BUREAU OF ENERGY EFFICIENCY
(Government of India, Ministry of Power)

F.No. BLDS-13/1/23-BEE / 6578

23rd January, 2024

Subject: Invitation for Feedback on Draft Energy Conservation and Sustainable Building Code (Commercial and Office Buildings)

Dear Madam/Sir,

In view of the amendment to Energy Conservation Act in December 2022, Energy Conservation and Building Code (ECBC) is under revision to Energy Conservation and Sustainable Building Code-Commercial and office Building for the inclusion of sustainability features.

Enclosed herewith is the draft of the Energy Conservation and Sustainable Building Code (Commercial and Office Buildings). We value your expertise and invite you to meticulously review and examine the document.

| Doc. No. | Title |
|----------------------|---|
| ECSBC.Version 1:2024 | Draft Energy Conservation and Sustainable Building Code (Draft ECSBC) – Commercial and Office Buildings |

Your valuable insights are crucial to ensuring the effectiveness of this code. We kindly request you to provide your comments and suggestions on the document. Your expertise will contribute significantly to the enhancement of industry standards.

Submission Details:

Please email your comments, using the prescribed format enclosed with this message, to ecsbcfeedback@gmail.com & sdiddi@beeindia.gov.in by **12th Feb 2024**.

Presumed Approval:

If no comments are received by the stipulated deadline, it will be presumed that the document requires no further corrections.

Review Process:

In the event of comments and suggestions, the competent authority will thoroughly review and consider each input before finalizing the document. Your contributions will play a pivotal role in shaping the code's success.

We have attached the specified format for your convenience. Kindly adhere to this format, as any deviation will not be entertained during the review process. Thank you for your commitment to sustainability, and we look forward to your constructive feedback.

Yours faithfully,

(Saurabh Diddi)
Director

Section 1

20

ECSBC – PURPOSE

21

DRAFT FOR STAKEHOLDER CONSULTATION

22 The focus on reducing energy consumption in buildings has increased worldwide. This is because the
23 consumption of fossil fuels for the full-fledged operations of a building is as high as it is in other industries.
24 Therefore, the adoption of energy efficiency techniques during the construction and operation of buildings
25 would play a crucial role in the creation of sustainable cities in the future. This is also not just about the use
26 of specific technologies or materials; but about a holistic approach to design and construction that
27 considers the building's entire lifecycle. This includes considering the building's location, orientation, and
28 layout, as well as the local climate and the building's intended use. It reduces household expenses and
29 decreases carbon dioxide emissions.

30

31 The Energy Conservation and Sustainable Building Code in India was developed to provide minimum
32 requirements for the energy-efficient design and construction of buildings. The Code provides two
33 additional sets of incremental requirements over and above the minimum efficiency level for buildings to
34 achieve enhanced levels of energy efficiency that go beyond the minimum requirements. It is expected
35 that adoption of ECSBC code would also have an impact indoor air pollution as they provide cleaner and
36 better ventilation than conventional buildings. As a result, the possibility of air pollution-related diseases
37 can be avoided to greater extent.

38 Energy Conservation Building Code (ECBC) was first published in 2009 and subsequently revised in 2017.
39 This second revision has been undertaken to align it with the latest development in the building sector and
40 to take into account the sustainable building in cities. This second revision has also taken into consideration
41 the energy efficiency improvement in buildings and revised energy efficiency requirements of equipment
42 and appliances used in buildings for several application over the years. Other salient changes and addition
43 in this revision are a) inclusion of new sections and b) changes in the requirements, methodology and
44 addition of new definitions in the existing sections. The new sections which have been added in this second
45 revisions are:

- 46 a) Sustainable site and planning
- 47 b) Water management and Controls
- 48 c) Waste Management
- 49 d) Indoor environmental Quality
- 50 e) Building Commissioning
- 51 f) IOT and Controls

55

56

57

58

59

Section – 2

60

SCOPE OF ECSBC

61

DRAFT FOR STAKEHOLDER CONSULTATION

62 The Code is applicable to buildings or building complexes that have a connected load of 100 kW or greater
63 or a contract demand of 120 kVA or greater and are intended to be used for commercial purposes.

64 Buildings intended for private residential purposes only are not covered by the Code.

65 Energy Efficiency Performance Levels

66 The code prescribes the following three levels of energy efficiency:

- 67 (a) Energy Conservation and Sustainable Building Code Compliant Building (ECSBC Building)
- 68 (b) Energy Conservation and Sustainable Building Code Plus Building (ECSBC+ Building)
- 69 (c) Super Energy Conservation and Sustainable Building Code Building (SuperECSBC Building)

70 Precedence

71 The following codes, programs, and policies will take precedence over the Code in case of conflict:

- 72 (a) Any policy notified as taking precedence over this Code, or any other rules on safety, security, health,
73 or environment by Central, State, or Local Government.
- 74 (b) Bureau of Energy Efficiency's Standards and Labelling for appliances and Star Rating Program for
75 buildings provided both or either are more stringent than the requirements of this Code.

76 Building Classification

77 Any one or more building or part of a building with commercial use is classified as per the functional
78 requirements of its design, construction, and use. The key classification is as below:

79 **(a) Hospitality:** Any building in which sleeping accommodation is provided for commercial purposes, except
80 any building classified under Health Care. Buildings and structures under Hospitality shall include the
81 following:

- 82 i. No-star Hotels – like Lodging-houses, dormitories, no-star hotels/motels
- 83 ii. Resort
- 84 iii. Star Hotel

85 **(b) Health Care:** Any building or part thereof, which is used for purposes such as medical or other treatment
86 or care of persons suffering from physical or mental illness, disease, or infirmity; care of infants,
87 convalescents, or aged persons, and for penal or correctional detention in which the liberty of the inmates is
88 restricted. Health Care buildings ordinarily provide sleeping accommodation for the occupants. Buildings and
89 structures like hospitals, sanatoria, out-patient healthcare, laboratories, research establishments, and test
90 houses are included under this type.

91

92 **(c) Assembly:** Any building or part of a building, where number of persons congregate or gather for
93 amusement, recreation, social, religious, patriotic, civil, travel and similar purposes. Buildings like theatres
94 or motion picture halls, gathering halls, and transport buildings like airports, railway stations, bus stations,
95 and underground and elevated mass rapid transit system are included in this group.

96

97 **(d) Office/Business:** Any building or part thereof which is used for transaction of business, for keeping
98 of accounts and records and similar purposes, professional establishments, and service facilities.
99 There are two subcategories under Office/Business – Daytime Office/Business and 24-hour Office/Business.
100 Unless otherwise mentioned, Office/Business buildings shall include both Daytime and 24-hour
101 subcategories.

102

103 **(e) Educational:** Any building used for schools, colleges, universities, and other training institutions for day-
104 care purposes involving assembly for instruction, education, or recreation for students. If residential
105 accommodation is provided in the schools, colleges, or universities or coaching/ training institution, that
106 portion of occupancy shall be classified as a No-star Hotel. Buildings and structures under Educational shall
107 include following types-

- 108 i. Schools
109 ii. All other types of institutes, e.g. college, university, training institutes etc.
- 110 (f) **Shopping Complex:** Any building or part thereof, which is used as shops, stores, market, for display and
111 sale of merchandise, either wholesale or retail. Buildings like shopping malls, stand-alone retails, open
112 gallery malls, super markets, or hyper markets are included in this type.
113
- 114 (g) **Mixed-use Building:** In a mixed-use building, each commercial part of a building must be classified
115 separately, and –
- 116 i. If a part of the mixed-use building has different classification and is less than 10% of the total above
117 grade floor area, the mixed-use building shall show compliance based on the building sub-
118 classification having higher percentage of above grade floor area.
- 119 ii. If a part of the mixed-use building has different classification and one or more sub-classification is
120 more than 10% of the total above grade floor area, the compliance requirements for each sub-
121 classification, having area more than 10% of above grade floor area of a mixed-use building.
- 122 Any building which does not fall under any of the categories defined above shall be classified in a category
123 mentioned above that best describes the function of the building.
- 124

DRAFT FOR STAKEHOLDER CONSULTATION

125

Section 3

126

DEFINITIONS

127

DRAFT FOR STAKEHOLDER CONSULTATION

128 **General**

129 Certain terms, abbreviations, and acronyms are defined in this section for the purposes of this code. These
130 definitions are applicable to all sections of this code. Terms that are not defined shall have their ordinarily
131 accepted meanings within the context in which they are used.

132 **Definitions**

133 **A**

134 **Above grade area (AGA):** AGA is the cumulative floor area of all the floor levels of a building that are above
135 the ground level. Ground level shall be as defined in building site plan. A floor level is above grade if one-
136 third of the total external surface area of only the said floor level is above the ground level.

137 **Accredited independent laboratory:** testing laboratory not affiliated with producer or consumer of goods
138 or products tested at the laboratory and accredited by national or international organizations for technical
139 competence.

140 **Addition:** an extension or increase in floor area or height of a building outside of the existing building
141 envelope.

142 **Air conditioning and condensing units serving computer rooms:** air conditioning equipment that provides
143 cooling by maintaining space temperature and humidity within a narrow range. Major application is in data
144 centers where dissipating heat generated by equipment takes precedence over comfort cooling for
145 occupants.

146 **Alternate Water Source:** Non-potable source of water that includes gray water, on-site treated water,
147 harvested rainwater, and reclaimed (recycled) water from sewage treatment plant.

148 **Alteration:** any change, rearrangement, replacement, or addition to a building or its systems and
149 equipment; any modification in construction or building equipment.

150 **Area weighted average (AWA) method:** AWA method is based on the concept of weighted arithmetic
151 mean where instead of each data point contributing equally to the final mean; each data point contributes
152 more "weight" than others based on the size of the area the said data point is applicable to. To calculate
153 the area weighted average mean, a summation of each data point multiplied with its respective area is
154 divided with the total area.

155
$$AWA = \sum \frac{(Data\ point\ X\ area)}{Total\ area}$$

156 **Astronomical time control:** an automatic time control that makes an adjustment for the length of the day
157 as it varies over the year.

158 **Automatic Control Device:** a device capable of automatically turning loads off and on without manual
159 intervention.

160 **Authority having jurisdiction:** the agency or agent responsible for enforcing this code.

161 **B**

162

163 **Backflow:** The flow of water or other liquids, mixtures, or substances into the distributing pipes of a potable
164 supply of water from any sources other than its intended source. See Back- Siphonage, Back-Pressure
165 Backflow.

166 **Balancing, air system:** adjusting airflow rates through air distribution system devices, such as fans and
167 diffusers, by manually adjusting the position of dampers, splitters vanes, extractors, etc., or by using
168 automatic control devices, such as constant air volume or variable air volume boxes.

169 **Balancing, hydronic system:** adjusting water flow rates through hydronic distribution system devices, such
170 as pumps and coils, by manually adjusting the position valves, or by using automatic control devices, such
171 as automatic flow control valves.

172 **Ballast:** unit inserted between the supply and one or more discharge lamps which by means of inductance,
173 capacitance or resistance, single or in combination, serves mainly to limit the current of the lamp(s) to the
174 required value. It may also include means for transforming from the supply voltage and arrangements
175 which help to provide starting voltage and preheating current, prevent cold starting, reduce stroboscopic
176 effect, correct the power factor and suppress radio interference.

177 **Standard Design:** a computer model of a hypothetical building, based on actual building design, that fulfils
178 all the mandatory requirements and minimally complies with the prescriptive requirements of ECSBC.

179 **Boiler:** a self-contained low-pressure appliance for supplying steam or hot water

180 **Brownfield Site:** Real property or the expansion, redevelopment, or reuse of which may be complicated by
181 the presence or possible presence of a hazardous substance, pollutant, or contaminant.

182 **Building or building complex or complex:** a structure wholly or partially enclosed within exterior walls, or
183 within exterior and party walls, and a roof, affording shelter to persons, animals, or property. Building
184 complex means a building or group of buildings constructed in a contiguous area for business, commercial,
185 institutional, healthcare, hospitality purposes or assembly buildings under the single ownership of
186 individuals or group of individuals or under the name of a co-operative group society or on lease and sold
187 as shops or office space or space for other commercial purposes, having a connected load of 100 kW or
188 contract demand of 120 kVA and above.

189 **Building, base:** includes building structure, building envelope, common areas, circulation areas, parking,
190 basements, services area, plant room and its supporting areas and, open project site area.

191 **Building, core and shell:** buildings where the developer or owner will only provide the base building and
192 its services.

193 **Building, existing:** a building or portion thereof that was previously occupied or approved for occupancy
194 by the authority having jurisdiction.

195 **Building envelope:** the exterior plus the semi-exterior portions of a building. For the purposes of
196 determining building envelope requirements, the classifications are defined as follows:

197 (a) Building envelope, exterior: the elements of a building that separate conditioned spaces from the
198 exterior

199 (b) Building envelope, semi-exterior: the elements of a building that separate conditioned space from
200 unconditioned space or that enclose semi-heated spaces through which thermal energy may be
201 transferred to or from the exterior, or to or from unconditioned spaces, or to or from conditioned

202 spaces
203 **Building grounds lighting:** lighting provided through a building's electrical service for parking lot, site,
204 roadway, pedestrian pathway, loading dock, and security applications

205 **Building material:** any element of the building envelope through which heat flows and that heat is included
206 in the component U-factor calculations other than air films and insulation

207 **Built up area (BUA):** sum of the covered areas of all floors of a building, other than the roof, and areas
208 covered by external walls and parapet on these floors.

209 **24-hour Business Building:** Business building operated and occupied for more than 12 hours on each
210 weekday. Intensity of occupancy may vary.

211 **Bar:** 1 Bar pressure is equivalent to 1 kg/cm² or 10 m of water column.
212

213 **Backflow:** The flow of water or other liquids, mixtures, or substances into the distributing pipes of a potable
214 supply of water from any sources other than its intended source. See Back- Siphonage, Back-Pressure
215 Backflow.

216 **Bio digester:** Biogas digester uses natural anaerobic decomposition of organic matter under controlled
217 conditions to convert organic waste into manure.

218 **Black Water:** Wastewater from toilet, bidet, urinals, kitchen sink, bed pan sink or similar contaminated
219 sources.
220

221 **C**

222

223 **Cardinal direction:** cardinal directions or cardinal points are the four main directional points of a compass:
224 north, south, east, and west **Centralized control:** single hardware/ software for observing and controlling
225 operations of a group of equipment and devices with similar or different functions

226 **Circuit breaker:** a safety device that automatically stops flow of current in electrical circuits. It protects the
227 circuit from current surge.

228 **Class of construction:** classification that determines the construction materials for the building envelope,
229 roof, wall, floor, slab-on-grade floor, opaque door, vertical fenestration, skylight

230 **Coefficient of Performance (COP) – cooling:** the ratio of the rate of heat removal to the rate of energy
231 input, in consistent units, for a complete refrigerating system or some specific portion of that system under
232 designated operating conditions

233 **Coefficient of Performance (COP) – heating:** the ratio of the rate of heat delivered to the rate of energy
234 input, in consistent units, for a complete heat pump system, including the compressor and, if applicable,
235 auxiliary heat, under designated operating conditions

236 **Common area:** areas within a building that are available for use by all tenants in a building (i.e. lobbies,
237 corridors, restrooms, etc.)

238 **Commercial building:** a building or a part of building or building complex which are used or intended to be
239 used for commercial purposes and classified as per the time of the day the building is operational and sub
240 classified, as per the functional requirements of its design, construction, and use as per following details:

- 241 a) Group I – 24 hours building covering Type A Hospitality, Type B Health Care and Type C Assembly,
242 Type D Business and,
243 b) Group II – Regular building covering Type D Business, Type E Educational and Type F Shopping
244 Complexes.

245 **Compliance documents:** the forms specified in ECSBC Rules and Regulations to record and check
246 compliance with these rules. These include but are not limited to EPI Ratio Compliance Report, Building
247 Envelope Compliance Form, Mechanical Systems Compliance Form and Permit Checklist, Lighting System
248 Compliance Form and Permit Checklist and certificates from Certified Energy Auditor for existing or
249 proposed buildings.

250 **Connected load:** the sum of the rated wattage of all equipment, appliances and devices to be installed in
251 the building or part of building or building complexes, in terms of kilowatt (kW) that will be allocated to all
252 applicants for electric power consumption in respect of the proposed building or building complexes on
253 their completion.

254 **Contaminant:** Any substance, that is potentially hazardous to human health or the environment and is
255 present in the environment at concentrations above its natural or background concentration.

256 **Contamination:** An impairment of the quality of the potable water that creates an actual hazard to the
257 public health through poisoning or through the spread of disease by sewage, industrial fluids, or waste.
258 Also defined as High Hazard.

259 **Contract demand:** the maximum demand in kilo Volt Ampere (kVA) (within a consumer's sanctioned load)
260 agreed to be supplied by the electricity provider or utility in the agreement executed between the user and
261 the utility or electricity provider.

262 **Construction documents:** drawings or documents, containing information pertaining to building
263 construction processes and approvals, building materials and equipment specification, architectural details
264 etc. required by the authority having jurisdiction.

265 **Controls or control device:** manually operated or automatic device or software to regulate the operation
266 of building equipment

267 **Cool roof:** roof with top layer of material that has high solar reflectance and high thermal emittance
268 properties. Cool roof surfaces are characterized by light colors so that heat can be rejected back to the
269 environment.

270 **Cumulative design EPI:** energy performance index for a building having two or more different functional
271 uses and calculated based on the area weighted average (AWA) method

272 **D**

273 **Daylight area:** the daylight illuminated floor area under horizontal fenestration (skylight) or adjacent to
274 vertical fenestration (window), described as follows:

- 275 (a) Horizontal Fenestration: the area under a skylight, monitor, or sawtooth configuration with an
276 effective aperture greater than 0.001 (0.1%). The daylight area is calculated as the horizontal

277 dimension in each direction equal to the top aperture dimension in that direction plus either the
 278 floor-to-ceiling height (H) for skylights, or 1.5 H for monitors, or H or 2H for the sawtooth
 279 configuration, or the distance to the nearest 1 meter or higher opaque partition, or one-half the
 280 distance to an adjacent skylight or vertical glazing, whichever is least, as shown in the plan and
 281 section figures below.

282

283

284

285

286

287 (b) Vertical Fenestration: the floor area adjacent to side apertures (vertical fenestration in walls) with
 288 an effective aperture greater than 0.06 (6%). The daylight area extends into the space
 289 perpendicular to the side aperture a distance equal to daylight extension factor (DEF) multiplied
 290 by the head height of the side aperture or till higher opaque partition, whichever is less. In the
 291 direction parallel to the window, the daylight area extends a horizontal dimension equal to the
 292 width of the window plus either 1 meter on each side of the aperture, or the distance to an opaque
 293 partition, or one-half the distance to an adjacent skylight or window, whichever is least.

294

295 **Daylight Extension Factor (DEF):** factor to manually calculate the daylight area on floor plates. It is to be
 296 multiplied by the head height of windows. It is dependent on orientation and glazing VLT, shading devices
 297 adjacent to it and building location.

298 **Daytime Business Building:** Business building operated typically only during daytime on weekdays up to
 299 12 hours each day.

300 **Daylight window:** fenestration 2.2 meter above floor level, with an interior light shelf at bottom of this
 301 fenestration

302 **Dead band:** the range of values within which a sensed variable can vary without initiating a change in the
 303 controlled process.

304 **Demand:** maximum rate of electricity (kW) consumption recorded for a building or facility during a selected
 305 time frame.

306 **Demand control ventilation (DCV):** a ventilation system capability that provides automatic reduction of
 307 outdoor air intake below design rates when the actual occupancy of spaces served by the system is less
 308 than design occupancy

309 **Demand factor:** is the ratio of the sum of the maximum demand of a system (or part of a system) to the
 310 total connected load on the system (or part of the system) under consideration. Demand factor is always
 311 less than one.

312 **Design capacity:** output capacity of a mechanical or electrical system or equipment at design conditions

313 **Design conditions:** specified indoor environmental conditions, such as temperature, humidity and light
 314 intensity, required to be produced and maintained by a system and under which the system must operate

315 **Distribution system:** network or system comprising controlling devices or equipment and distribution
 316 channels (cables, coils, ducts, pipes etc.) for delivery of electrical power or, cooled or heated water or air
 317 in buildings.

318 **Domestic Sewage:** The liquid and water-borne wastes derived from the ordinary living processes, free
 319 from industrial wastes, and of such character as to permit satisfactory disposal, without special treatment,
 320 into the public sewer or by means of a private sewage disposal system.

321

322 **Domestic Water:** Potable water provided for domestic purposes such as drinking, cooking and supply to
323 fixtures such as kitchen sink, washbasins, shower, clothes washer and dishwasher.

324 **Door:** all operable opening areas, that are not more than one half glass, in the building envelope, including
325 swinging and roll-up doors, fire doors, and access hatches.

326 **Door area:** total area of the door measured using the rough opening and including the door slab and the
327 frame.

328 **Drinking Water:** Drinking water is water intended for human consumption for drinking and cooking
329 purposes from any source. It includes water (treated or untreated) supplied by any means for human
330 consumption.

331

332 **E**

333 **Economizer, air:** a duct and damper arrangement with automatic controls that allow a cooling system to
334 supply outdoor air to reduce or eliminate the need for mechanical cooling during mild or cold weather

335 **Economizer, water:** a system by which the supply air of a cooling system is cooled indirectly with water
336 that is itself cooled by heat or mass transfer to the environment without the use of mechanical cooling

337 **ECSBC Building:** a building that complies with the mandatory requirements of §4A to §13 and also complies
338 either with the prescriptive requirements stated under the ECSBC Building categories of §4A to §13, or,
339 with the whole building performance compliance method of §14.

340 **ECSBC+ Building:** a building that complies with the mandatory requirements of §4A to §13 and also
341 complies either with the prescriptive requirements stated under the ECSBC+ Building categories of §4A to
342 §13, or, with the whole building performance compliance method of §14. This is a voluntary level of
343 compliance with ECSBC.

344 **Effective aperture:** Visible light transmittance x window-to-wall Ratio. ($EA = VLT \times WWR$)

345 **Efficacy:** the lumens produced by a lamp plus ballast system divided by the total watts of input power
346 (including the ballast), expressed in lumens per watt

347 **Efficiency:** performance at a specified rating condition

348 **Efficiency, thermal:** ratio of work output to heat input

349 **Efficiency, combustion:** efficiency with which fuel is burned during the combustion process in equipment

350 **Emittance:** the ratio of the radiant heat flux emitted by a specimen to that emitted by a blackbody at the
351 same temperature and under the same conditions

352 **Energy:** power derived from renewable or non-renewable resources to provide heating, cooling and light
353 to a building or operate any building equipment and appliances. It has various forms such as thermal (heat),
354 mechanical (work), electrical, and chemical that may be transformed from one into another. Customary
355 unit of measurement is watts (W)

356 **Energy Efficiency Ratio (EER):** the ratio of net cooling capacity in watt to total rate of electric input in watts
357 under design operating conditions

358 **Energy recovery system:** equipment to recover energy from building or space exhaust air and use it to treat
359 (pre-heat or pre-cool) outdoor air taken inside the building or space by ventilation systems

360 **Envelope Performance Factor (EPF):** value for the building envelope performance compliance option
361 calculated using the procedures specified in 4B.3.5 and 4B.3.5.1.1. For the purposes of determining building
362 envelope requirements the classifications are defined as follows:

363 (a) Standard Building EPF: envelope performance factor calculated for the Standard Building using
364 prescriptive requirements for walls, vertical fenestrations and roofs

365 (b) Proposed Building EPF: the building envelope performance factor for the Proposed Building using
366 proposed values for walls, vertical fenestrations and roofs

367 **Energy Performance Index (EPI):** of a building means its annual energy consumption in kilowatt-hours per
368 square meter of the area of the building which shall be calculated in the existing or proposed building as
369 per the formula below,

$$370 = \frac{\text{annual energy consumption in kWh}}{\text{total built - up area (excluding storage area and the parking in the basement) in m}^2}$$

371 **EPI Ratio:** of a building means the ratio of the EPI of the Proposed Building to the EPI of the Standard
372 Building.

373 **Equipment:** mechanical, electrical or static devices for operating a building, including but not limited to
374 those required for providing cooling, heating, ventilation, lighting, service hot water, vertical circulation

375 **Equipment, existing:** equipment previously installed in an existing building

376 **Equivalent SHGC:** SHGC for a fenestration with a permanent external shading projection. It is calculated
377 using the Projection Factor (PF) of the permanent external shading projection and Shading Equivalent
378 Factor (SEF) listed in §4B.3.1.

379 **Exemption:** any exception allowed to compliance with ECSBC requirements

380 **F**

381 **Fan system power:** sum of the nominal power demand (nameplate W or HP) of motors of all fans that are
382 required to operate at design conditions to supply air from the heating or cooling source to the conditioned
383 space(s) and return it to the point where it can be exhausted to outside the building.

384 **Fenestration:** all areas (including the frames) in the building envelope that let in light, including windows,
385 plastic panels, clerestories, skylights, glass doors that are more than one-half glass, and glass block walls.

386 (a) Skylight: a fenestration surface having a slope of less than 60 degrees from the horizontal plane.
387 Other fenestration, even if mounted on the roof of a building, is considered vertical fenestration.

388 (b) Vertical fenestration: all fenestration other than skylights. Trombe wall assemblies, where glazing
389 is installed within 300 mm of a mass wall, are considered walls, not fenestration.

390 **Fenestration area:** total area of the fenestration measured using the rough opening and including the
391 glazing, sash, and frame. For doors where the glazed vision area is less than 50% of the door area, the
392 fenestration area is the glazed vision area. For all other doors, the fenestration area is the door area.

393 **Finished floor level:** level of floor achieved after finishing materials have been added to the subfloor or
394 rough floor or concrete floor slab.

395 **Fossil fuel:** fuel derived from a hydrocarbon deposit such as petroleum, coal, or natural gas derived from
396 living matter of a previous geologic time

397 **Fresh Water:** Water obtained from Municipal, Public Utility, bore well, open well and bought out water
398 for domestic use.

399 **Fuel:** a material that may be used to produce heat or generate power by combustion

400 **Fuel utilization efficiency (FUE):** a thermal efficiency measure of combustion equipment like furnaces,
401 boilers, and water heaters

402 **G**

403 **Gathering hall (Type of Assembly):** any building, its lobbies, rooms and other spaces connected thereto,
404 primarily intended for assembly of people, but which has no theatrical stage or permanent theatrical
405 and/or cinematographic accessories and has gathering space for greater or equal to 100 persons, for
406 example, stand-alone dance halls, stand-alone night clubs, halls for incidental picture shows, dramatic,
407 theatrical or educational presentation, lectures or other similar purposes having no theatrical stage except
408 a raised platform and used without permanent seating arrangement; art galleries, community halls,
409 marriage halls, places of worship, museums, stand-alone lecture halls, passenger terminals and heritage
410 and archaeological monuments, pool and billiard parlour, bowling alleys, community halls, courtrooms,
411 gymnasiums, indoor swimming pools, indoor tennis court, any indoor stadium for sports and culture,
412 auditoriums

413 **Grade:** finished ground level adjoining a building at all exterior walls

414 **Gray Water:** Untreated wastewater that has not come into contact with toilet waste, kitchen sink waste,
415 or similarly contaminated sources. Gray water includes wastewater from bathtubs, showers, lavatories,
416 clothes washers, laundry tubs, dishwashers and domestic RO reject water.

417 **Guest room:** any room or rooms used or intended to be used by a guest for sleeping purposes

418 **H**

419 **Habitable spaces:** space in a building or structure intended or used for working, meeting, living, sleeping,
420 eating, or cooking. Bathrooms, water closet compartments, closets, halls, storage or utility space, and
421 similar areas are not considered habitable spaces.

422 **Heat Island Effect:** the thermal absorption by hardscape, such as dark, nonreflective pavement and
423 buildings, and its subsequent radiation to surrounding areas. Other contributing factors may include vehicle
424 exhaust, air conditioners, and street equipment. Tall buildings and narrow streets reduce airflow and
425 exacerbate the effect.

426 **Hospitals and sanatoria (Healthcare):** Any building or a group of buildings under single management,
427 which is used for housing persons suffering from physical limitations because of health or age and those
428 incapables of self-preservation, for example, any hospitals, infirmaries, sanatoria and nursing homes.

429 **HVAC system:** equipment, distribution systems, and terminal devices that provide, either collectively or
430 individually, the processes of heating, ventilating, or air conditioning to a building or parts of a building.

431 **Hyper Markets (Type F of Shopping Complex):** large retail establishments that are a combination of
432 supermarket and department stores. They are considered as a one-stop shop for all needs of the customer.

433 **I**

434 **Infiltration:** uncontrolled inward air leakage through cracks and crevices in external surfaces of buildings,
435 around windows and doors due to pressure differences across these caused by factors such as wind or
436 indoor and outside temperature differences (stack effect), and imbalance between supply and exhaust air
437 systems

438 **Installed interior lighting power:** power in watts of all permanently installed general, task, and furniture
439 lighting systems and luminaries.

440 **Integrated part-load value (IPLV):** weighted average efficiency of chillers measured when they are
441 operating at part load conditions (less than design or 100% conditions). It is more realistic measurement of
442 chillers efficiency during its operational life.

443 **Inventory:** A complete list of items such as property, goods in stock, or the contents of a building
444

445 **L**

446 **Labeled:** equipment or materials to which a symbol or other identifying mark has been attached by the
447 manufacturer indicating compliance with specified standard or performance in a specified manner.

448 **Lighted floor area, gross:** gross area of lighted floor spaces

449 **Lighting, decorative:** lighting that is ornamental or installed for aesthetic effect. Decorative lighting shall
450 not include general lighting.

451 **Lighting, emergency:** battery backed lighting that provides illumination only when there is a power outage
452 and general lighting luminaries are unable to function.

453 **Lighting, general:** lighting that provides a substantially uniform level of illumination throughout an area.
454 General lighting shall not include decorative lighting or lighting that provides a dissimilar level of
455 illumination to serve a specialized application or feature within such area.

456 **Lighting system:** a group of luminaires circuited or controlled to perform a specific function.

457 **Lighting power allowance:**

458 (a) Interior lighting power allowance: the maximum lighting power in watts allowed for the interior of
459 a building.

460 (b) Exterior lighting power allowance: the maximum lighting power in watts allowed for the exterior
461 of a building.

462 **Lighting Power Density (LPD):** maximum lighting power per unit area of a space as per its function or
463 building as per its classification.

464 **Low energy comfort systems:** space conditioning or ventilation systems that are less energy intensive than
465 vapour compression-based space condition systems. These primarily employ alternate heat transfer
466 methods or materials (adiabatic cooling, radiation, desiccant, etc.), or renewable sources of energy (solar
467 energy, geo-thermal) so that minimal electrical energy input is required to deliver heating or cooling to
468 spaces.

469 **Luminaire:** Equipment which distributes, filters or transforms the light transmitted from one or more
470 lamps and which includes all the parts necessary for supporting, fixing and protecting the lamps, but not
471 the lamps themselves, and where necessary, circuit auxiliaries together with the means for connecting
472 them to the supply.

473 Note: A luminaire with integral non-replaceable lamps is regarded as a luminaire, except that the tests
474 are not applied to the integral lamp or integral self-ballasted lamp.
475

476 **M**

477 **Man-made daylight obstruction:** any permanent man-made object (equipment, adjacent building) that
478 obstructs sunlight or solar radiation from falling on a portion or whole of a building's external surface at
479 any point of time during a year is called as a man-made sunlight obstructer.

480 **Manual (non-automatic):** requiring personal intervention for control. Non-automatic does not necessarily
481 imply a manual controller, only that personal intervention is necessary.

482 **Manufacturing processes:** processes through which raw material is converted into finished goods for
483 commercial sale using machines, labor, chemical or biological processes, etc.

484 **Manufacturer:** company or person or group of persons who produce and assemble goods or purchases
485 goods manufactured by a third party in accordance with their specifications.

486 **Mean temperature:** average of the minimum daily temperature and maximum daily temperature.

487 **Mechanical cooling:** reducing the temperature of a gas or liquid by using vapor compression, absorption,
488 and desiccant dehumidification combined with evaporative cooling, or another energy-driven
489 thermodynamic cycle. Indirect or direct evaporative cooling alone is not considered mechanical cooling.

490 **Metered Faucet:** A self-closing factory calibrated faucet that dispenses a predetermined volume of water
491 for each cycle.

492 **Metering:** practice of installing meters in buildings to acquire data for energy consumption and other
493 operational characteristics of individual equipment or several equipment grouped on basis of their function
494 (lighting, appliances, chillers, etc.). Metering is done in buildings to monitor their energy performance.

495 **Mixed mode air-conditioned building:** building in which natural ventilation is employed as the primary
496 mode of ventilating the building, and air conditioning is deployed as and when required.

497 **Mixed use development:** a single building or a group of buildings used for a combination of residential,
498 commercial, business, educational, hospitality and assembly purposes

499 **N**

500 **National Building Code 2016 (NBC):** model building code that provides guidelines for design and
501 construction of buildings. In this code, National Building Code 2016 refers to the latest version by the
502 Bureau of Indian Standards.

503 **Natural daylight obstruction:** any natural object, like tree, hill, etc., that obstructs sunlight from falling on
504 part or whole of a building's external surface at any point of time during a year and casts a shadow on the
505 building surface.

506 **Naturally ventilated building:** a building that does not use mechanical equipment to supply air to and
507 exhaust air from indoor spaces. It is primarily ventilated by drawing and expelling air through operable
508 openings in the building envelope.

509 **Net Exposed Roof Area:** Net exposed roof area = Total roof area – equipment area

510 **Non-cardinal directions:** any direction which is not a cardinal direction, i.e. perfect north, south, east, or
511 west, is termed as non-cardinal direction.

512 **No Star hotel (Type of Hospitality):** any building or group of buildings under the same management, in
513 which separate sleeping accommodation on commercial basis, with or without dining facilities or cooking
514 facilities, is provided for individuals. This includes lodging rooms, inns, clubs, motels, no star hotel and guest
515 houses and excludes residential apartments rented on a lease agreement of 4 months or more. These shall
516 also include any building in which group sleeping accommodation is provided, with or without dining
517 facilities for persons who are not members of the same family, in one room or a series of adjoining rooms
518 under joint occupancy and single management, for example, school and college dormitories, students, and
519 other hostels and military barracks.

520 **O**

521 **Occupant/Occupancy sensor:** a device that detects the presence or absence of people within an area and
522 causes lighting, equipment, or appliances to be dimmed, or switched on or off accordingly.

523 **On-site electricity generation systems:** systems located at the building site that generate electricity,
524 including, but not limited to, generators, combined heat and power systems, fuel cells, and on-site
525 renewable energy systems.

526 **On-site renewable energy:** energy from renewable resources harvested at the building site.

527 **Opaque assembly or opaque construction:** surface of the building roof or walls other than fenestration
528 and building service openings such as vents and grills.

529 **Opaque external wall:** external wall composed of materials which are not transparent or translucent,
530 usually contains the structural part of the building, and supports the glazed façade. This type may be
531 composed of one or more materials.

532 **Open Gallery Mall (Type of Shopping Complex):** a large retail complex containing a variety of stores and
533 often restaurants and other business establishments housed in a series of connected or adjacent buildings
534 or in a single large building. The circulation area and atrium of the open gallery mall is an unconditioned
535 space and is open to sky.

536 **Organic waste:** Any material that is easily compostable and comes from either a plant or an animal.
537

538 **Organic waste converters (OWC):** Machines that are used to convert organic waste such as vegetable
539 waste, meat waste, bakery waste, leaves, fruits and fruit skins, and flowers into valuable compost that can
540 be used for organic farming activities.

541 **Orientation:** the direction a building facade faces, i.e., the direction of a vector perpendicular to and
542 pointing away from the surface of the facade. For vertical fenestration, the two categories are north-
543 oriented and all other.

544 **Outdoor (outside) air:** air taken from the outside the building and has not been previously circulated
545 through the building.

546 **Out-patient Healthcare (Type of Healthcare):** any building or a group of buildings under single
547 management, which is used only for treating persons requiring treatment or diagnosis of disease but not
548 requiring overnight or longer accommodation in the building during treatment or diagnosis.

549 **Overcurrent:** any current in excess of the rated current of the equipment of the ampacity of the conductor.
550 It may result from overload, short circuit, or ground fault.

551 **Overall Efficiency:** Efficiency of motor and pump considered together.

552 **Owner:** a person, group of persons, company, trust, institute, Registered Body, state or central
553 Government and its attached or sub-ordinate departments, undertakings and like agencies or organization
554 in whose name the property stands registered in the revenue records for the construction of a building or
555 building complex

556 **P**

557 **Party wall:** a firewall on an interior lot line used or adapted for joint service between two buildings.

558 **Paved Areas:** Paved area is an area that is paved with concrete, asphalt, stone, brick, gravel, or other
559 wearing surface.

560 **Permanently installed:** equipment that is fixed in place and is not portable or movable.

561 **pH:** pH is a figure expressing the acidity or alkalinity of a solution on a logarithmic scale on which 7 is
562 neutral, lower values are more acid and higher values more alkaline. The pH is equal to $-\log_{10} c$, where c
563 is the hydrogen ion concentration in moles per liter.

564 **Plenum:** a compartment or chamber to which one or more ducts are connected, that forms a part of the
565 air distribution system, and that is not used for occupancy or storage.

566 **Plug loads:** energy used by products that are powered by means of an AC plug. This term excludes building
567 energy that is attributed to major end uses specified in § 5, § 6, § 7, § 8, § 9, § 11 (like HVAC, lighting, water
568 heating, etc.).

569 **Plumbing Appliance:** Devices or equipment that are intended to perform a special plumbing function. Its
570 operation and/or control may be dependent upon one or more energized components, such as motors,
571 controls, heating elements, or pressure or temperature-sensing elements. Such device or equipment shall
572 be permitted to operate automatically or manually by the user or operator.

573

574 **Plumbing Appurtenance:** A device or assembly that is an adjunct to the basic piping system and plumbing
575 fixtures. An appurtenance demands no additional water supply, nor does it add any discharge load to a
576 fixture or the drainage system. It performs some useful function in the operation, maintenance, servicing,
577 economy, or safety of the plumbing system.

578

579 **Plumbing Fixture:** An approved-type receptacle or device that is supplied with water or that receives liquid
580 wastes and discharges such wastes into the drainage system to which it may be directly or indirectly
581 connected.

582

583 **Plumbing System:** Includes water, building supply, and distribution pipes; all plumbing fixtures, fittings,
584 appliances and appurtenances; all drainage and vent pipes; and all building drains and building sewers,
585 including on-site water and sewage treatment.

586 **Pool:** any structure, basin, or tank containing an artificial body of water for swimming, diving, or
587 recreational bathing. The terms include, but no limited to, swimming pool, whirlpool, spa, hot tub.

588 **Post occupancy:** The buyer of a property agrees to allow the seller of the property to stay in the property
589 past the settlement date.

590

591 **Potable Water:** Water that is satisfactory for drinking, culinary, and domestic purposes and that meets the
592 requirements of the Health Authority Having Jurisdiction.

593 **P&I Diagram:** Piping & Instrument diagram is a detail diagram which shows all the piping together with the
594 equipment's, instruments & control devices.

595 **Potential daylight time:** amount of time in a day when there is daylight to light a space adequately without
596 using artificial lighting. Potential daylight time is fixed for 8 hours per day i.e. from 09:00 AM to 5:00 PM local
597 time, resulting 2920 hours in total for all building types except for Type E-1 - Educational, which shall be
598 analyzed for 7 hours per day i.e. from 08:00 AM to 3:00 PM local time.

599 **Primary inter-cardinal direction:** any of the four points of the compass, midway between the cardinal
600 points; northeast, southeast, southwest, or northwest are called primary inter-cardinal direction.

601 **Process load:** building loads resulting from the consumption or release of energy due to industrial
602 processes or processes other than those for providing space conditioning, lighting, ventilation, or service
603 hot water heating.

604 **Projection factor, overhang:** It is the ratio of the horizontal depth of the external shading projection to the
605 sum of the height of the fenestration and the distance from the top of the fenestration to the bottom of
606 the farthest point of the external shading projection, in consistent units.

607

608 **Projection factor, side fin:** It is the ratio of the horizontal depth of the external shading projection to the
 609 distance from the window jamb to the farthest point of the external shading projection, in consistent units.

Projection factor Left Fin(PF_L)= $C/(A+W)$

Projection factor Right Fin(PF_R)= $C/(B+W)$

611 **Projection Factor, overhang and side fin:** average of ratio projection factor for overhang only and
 612 projection factor of side fin only.

613 **Proposed Building:** is consistent with the actual design of the building and complies with all the mandatory
 614 requirements of ECSBC.

615 **Proposed Design:** a computer model of the proposed building, consistent with its actual design, which
 616 complies with all the mandatory requirements of ECSBC.

617 **R**

618 **R-value (thermal resistance):** the reciprocal of the time rate of heat flow through a unit area induced by a
 619 unit temperature difference between two defined surfaces of material or construction under steady-state
 620 conditions. Units of R value are $m^2.K/W$.

621 **Readily accessible:** capable of being reached quickly for operation, renewal, or inspections without
622 requiring those to whom ready access is requisite to climb over or remove obstacles or to resort to portable
623 ladders, chairs, etc. In public facilities, accessibility may be limited to certified personnel through locking
624 covers or by placing equipment in locked rooms.

625 **Recirculating system:** a domestic or service hot water distribution system that includes a close circulation
626 circuit designed to maintain usage temperatures in hot water pipes near terminal devices (e.g., lavatory
627 faucets, shower heads) in order to reduce the time required to obtain hot water when the terminal device
628 valve is opened. The motive force for circulation is either natural (due to water density variations with
629 temperature) or mechanical (recirculation pump).

630 **Reclaimed (Recycled) Water:** Non-potable water generated, as a result of tertiary treatment of domestic
631 Black/Grey water that meets requirements of the Authority Having Jurisdiction for its intended uses.

632 **Remediation:** The doing of any works, or carrying out of any operations or taking of any steps in relation
633 to a polluted site for the purpose of (a) identifying or investigating or preventing or minimising or
634 remedying or mitigating the adverse effects by reason of which polluted site is such site; (b) restoring the
635 quality of environment, flora and fauna at the site to an acceptable level; and includes making of
636 subsequent inspections from time to time for the purpose of keeping under review the condition of the
637 site in question, in the manner prescribed.

638 **Renewable Energy Generating Zone:** a contiguous or semi-contiguous area, either on rooftop or elsewhere
639 within site boundary, dedicated for installation of renewable energy systems.

640 **Renewable Energy Resources:** energy from solar, wind, biomass or hydro, or extracted from hot fluid or
641 steam heated within the earth.

642 **Resort (Type of Hospitality):** commercial establishments that provide relaxation and recreation over and
643 above the accommodation, meals and other basic amenities. The characteristics of resort are as below –

- 644 i. Includes 1 or more recreation(s) facility like spa, swimming pool, or any sport;
645 ii. Is located in the midst of natural and picturesque surroundings outside the city;
646 iii. Comprises of 2 or more blocks of buildings within the same site less than or equal to 3 floors
647 (including the ground floor).

648 **Reset:** automatic adjustment of the controller set point to a higher or lower value.

649 **Roof:** the upper portion of the building envelope, including opaque areas and fenestration, that is
650 horizontal or tilted at an angle of less than 60° from horizontal. This includes podium roof as well which are
651 exposed to direct sun rays.

652 **Roof area, gross:** the area of the roof measured from the exterior faces of walls or from the centerline of
653 party walls

654 S

655 **Sedimentation Basin:** A sediment basin is a temporary pond built on a construction site to capture eroded
656 or disturbed soil that is washed off during rainstorms, and protect the water quality of a nearby stream,
657 river, lake, or bay. The sediment-laden soil settles in the pond before the runoff is discharged.

658 **Service:** the equipment for delivering energy from the supply or distribution system to the premises served.

659 **Service water heating equipment:** equipment for heating water for domestic or commercial purposes
660 other than space heating and process requirements.

661 **Set point:** the desired temperature (°C) of the heated or cooled space that must be maintained by
662 mechanical heating or cooling equipment.

663 **Sewage:** Wastewater containing human excreta (faeces and urine) as well as sources of black water and
664 grey water.

665 **Shading Coefficient (SC):** measure of thermal performance of glazing. It is the ratio of solar heat gain
666 through glazing due to solar radiation at normal incidence to that occurring through 3 mm thick clear,
667 double-strength glass. Shading coefficient, as used herein, does not include interior, exterior, or integral
668 shading devices.

669 **Shading Equivalent Factor:** coefficient for calculating effective SHGC of fenestrations shaded by overhangs
670 or side fins.

671 **Shopping Mall (Shopping Complex):** a large retail complex containing a variety of stores and often
672 restaurants and other business establishments housed in a series of connected or adjacent buildings or in
673 a single large building. The circulation area and atrium of the mall is an enclosed space covered completely
674 by a permanent or temporary structure.

675 **Simulation program:** software in which virtual building models can be developed to simulate the energy
676 performance of building systems and daylighting analysis

677 **Single-zone system:** an HVAC system serving a single HVAC zone.

678 **Site-recovered energy:** waste energy recovered at the building site that is used to offset consumption of
679 purchased fuel or electrical energy supplies.

680 **Slab-on-grade floor:** floor slab of the building that is in contact with ground and that is either above grade
681 or is less than or equal to 300 mm below the final elevation of the nearest exterior grade. **Solar energy**
682 **source:** source of thermal, chemical, or electrical energy derived from direction conversion of incident solar
683 radiation at the building site.

684 **Solar Heat Gain Coefficient (SHGC):** the ratio of the solar heat gain entering the space through the
685 fenestration area to the incident solar radiation. Solar heat gain includes directly transmitted solar heat
686 and absorbed solar radiation, which is then reradiated, conducted, or convected into the space.

687 **Solar Reflectance:** ratio of the solar radiation reflected by a surface to the solar radiation incident upon it.

688 **Solar Reflective Index:** A measure of the constructed surface's ability to stay cool in the sun by reflecting
689 solar radiation and emitting thermal radiation. It is defined such that a standard black surface (initial solar
690 reflectance 0.05, initial thermal emittance 0.90) has an initial SRI of 0, and a standard white surface (initial
691 solar reflectance 0.80, initial thermal emittance 0.90) has an initial SRI of 100. To calculate the SRI for a
692 given material, obtain its solar reflectance and thermal emittance via the Cool Roof Rating Council Standard
693 (CRRC-1). SRI is calculated according to ASTM E 1980. Calculation of the aged SRI is based on the aged,
694 tested values of solar reflectance and thermal emittance.

695 **Space:** an enclosed area within a building. The classifications of spaces are as follows for purpose of
696 determining building envelope requirements:

- 697 (a) Conditioned space: a cooled space, heated space, or directly conditioned space.
- 698 (b) Semi-heated space: an enclosed space within a building that is heated by a heating system whose
699 output capacity is greater or equal to 10.7 W/m^2 but is not a conditioned space.
- 700 (c) Non-conditioned space: an enclosed space within a building that is not conditioned space or a semi-
701 heated space. Crawlspace, attics, and parking garages with natural or mechanical ventilation are
702 not considered enclosed spaces.
- 703 **Standard Building:** A building that has the same building floor area, gross wall area and gross roof area as
704 the Proposed Building and it conforms to all the mandatory requirements of ECSBC compliant building.
- 705 **Sullage:** Wastewater without faecal matter. Commonly known as Gray water.
- 706 **Star Hotels/motels (Star Hotel):** any building or group of buildings under single management and
707 accredited as a starred hotel by the Hotel and Restaurant Approval and Classification Committee, Ministry
708 of Tourism, in which sleeping accommodation, with or without dining facilities is provided.
- 709 **Stand-alone Retail (Shopping Complex):** a large retail store owned or sublet to a single management which
710 may offer customers a variety of products under self-branding or products of different brands. The single
711 management shall have a complete ownership of all the spaces of the building and no space within the
712 building is further sold or sublet to a different management.
- 713 **Standard Building:** a building that minimally complies with all the mandatory and prescriptive
714 requirements of Energy Conservation Building Code and has same floor area, gross wall area, and gross
715 roof area of the Proposed Building.
- 716 **Standard Design:** a computer model of a hypothetical building, based on actual building design, that fulfils
717 all the mandatory requirements and minimally complies with the prescriptive requirements of ECSBC, as
718 described in the Whole Building Performance method.
- 719 **Story:** portion of a building that is between one finished floor level and the next higher finished floor level
720 or building roof. Basement and cellar shall not be considered a story.
- 721 **Summer Solar Insolation:** measure of solar radiation energy received on a given surface area from the
722 month of March to October within the same calendar year. Units of measurement are watts per square
723 meter (W/m^2) or kilowatt-hours per square meter per day ($\text{kW}\cdot\text{h}/(\text{m}^2\cdot\text{day})$) (or hours/day).
- 724 **SuperECSBC Building:** a building that complies with the mandatory requirements of section §4 to §13 and
725 also complies either with the prescriptive requirements stated under the SuperECSBC Building categories
726 of §4 to §13, or, with the whole building performance compliance method of §14. This is a voluntary level
727 of compliance with ECSBC.
- 728 **Super Market (Shopping Complex):** supermarkets are large self-service grocery stores that offer customers
729 a variety of foods and household supplies. The merchandise is organized into an organized aisle format,
730 where each aisle has only similar goods placed together.
- 731 **System:** a combination of equipment and auxiliary devices (e.g., controls, accessories, interconnecting
732 means, and terminal elements) by which energy is transformed so it performs a specific function such as
733 HVAC, service water heating, or lighting.

734 **System Efficiency:** the system efficiency is the ratio of annual kWh electricity consumption of equipment
735 of water cooled chilled water plant (i.e. chillers, chilled and condenser water pumps, cooling tower) to
736 chiller thermal kWh used in a building.

737 **System, existing:** a system or systems previously installed in an existing building.

738 **T**

739 **Tenant lease agreement:** The formal legal document entered into between a Landlord and a Tenant to
740 reflect the terms of the negotiations between them; that is, the lease terms have been negotiated and
741 agreed upon, and the agreement has been reduced to writing. It constitutes the entire agreement between
742 the parties and sets forth their basic legal rights.

743 **Tenant leased area:** area of a building that is leased to tenant(s) as per the tenant lease agreement.

744 **Terminal device:** a device through which heated or cooled air is supplied to a space to maintain its
745 temperature. It usually contains dampers and heating and cooling coils. Or a device by which energy form
746 a system is finally delivered, e.g., registers, diffusers, lighting fixtures, faucets, etc.

747 **Tactile warning blocks:** Tactile warning blocks indicate an approaching potential hazard or a change in
748 direction of the walkway, and serve as a warning of the approaching danger to persons with visual
749 impairments, preparing them to tread cautiously and expect obstacles along the travel path, traffic
750 intersections, doorways, etc.

751 **Theater or motion picture hall (Type of Assembly):** any building primarily meant for theatrical or operatic
752 performances, and which has a stage, proscenium curtain, fixed or portable scenery or scenery loft, lights,
753 mechanical appliances or other theatrical accessories and equipment for example, theaters, motion picture
754 houses, auditoria, concert halls, television and radio studios admitting an audience and which are provided
755 with fixed seats.

756 **Thermal block:** a collection of one or more HVAC zones grouped together for simulation purposes. Spaces
757 need not be contiguous to be combined within a single thermal block.

758 **Thermal comfort conditions:** conditions that influence thermal comfort of occupants. Environmental
759 conditions that influence thermal comfort air and radiant temperature, humidity, and air speed.

760 **Thermostat:** device containing a temperature sensor used to automatically maintain temperature at a
761 desirable fixed or adjustable set point in a space.

762 **Tinted:** (as applied to fenestration) bronze, green, or grey colouring that is integral with the glazing
763 material. Tinting does not include surface applied films such as reflective coatings, applied either in the
764 field or during the manufacturing process.

765 **Topsoil:** Topsoil is the upper layer of a soil profile, usually darker in colour (because of its higher organic
766 matter content) and more fertile than subsoil, and which is a product of natural, biological and
767 environmental processes.

768 **Transformer:** a static piece of apparatus with two or more windings which, by electromagnetic induction,
769 transforms a system of alternating voltage and current into another system of voltage and current usually
770 of different values and at the same frequency for the purpose of transmitting electrical power

771 **Transformer losses:** electrical losses in a transformer that reduces its efficiency.

772 **Transport Buildings (Assembly):** any building or structure used for the purpose of transportation and
773 transit like airports, railway stations, bus stations, and underground and elevated mass rapid transit system
774 example, underground or elevated railways.

775 **Type 1 Ecolabel:** Type I ecolabels are voluntary labels that signify overall environmental preference of a
776 product or services based on life-cycle considerations that address multiple environmental criteria, which
777 are based on transparent standards for environmental preferability, verified by a qualified organization.

778 **U**

779 **Unconditioned buildings:** building in which more than 90% of spaces are unconditioned spaces.

780 **Unconditioned space:** mechanically or naturally ventilated space that is not cooled or heated by
781 mechanical equipment.

782 **Universities and all others coaching/training institutions (Educational):** a building or a group of buildings,
783 under single management, used for imparting education to students numbering more than 100 or public
784 or private training institution built to provide training/coaching etc.

785 **Used Water:** Black or Grey water from fixtures or appliances.

786 **Useful Daylight Illuminance:** percentage of annual daytime hours that a given point on a work plane height
787 of 0.8 m above finished floor level receives daylight between 100 lux to 2,000 lux.

788 **U-factor (Thermal Transmittance):** heat transmission in unit time through unit area of a material or
789 construction and the boundary air films, induced by unit temperature difference between the
790 environments on each side. Unit of U value is $W/m^2.K$.

791 **V**

792 **Variable Air Volume (VAV) system:** HVAC system that controls the dry-bulb temperature within a space by
793 varying the volumetric flow of heated or cooled air supplied to the space

794 **Vegetative roofs:** also known as green roofs, they are thin layers of living vegetation installed on top of
795 conventional flat or sloping roofs.

796 **Ventilation:** the process of supplying or removing air by natural or mechanical means to or from any space.
797 Such air is not required to have been conditioned.

798 **Video conferencing:** Any space where one- or two-way audio and video communication is supported
799 between two or more sites (refer Figure below). Both audio (aural) and video (visual) communication are
800 supported in real time. The transfer and display of information and data such as documents and multimedia
801 program materials may also be available functions in a videoconference space.
802

803

804 **Vermicomposting:** It is a process in which earthworms are used to convert organic materials into humus-
 805 like material known as vermicompost.

806 **Vision Windows:** windows or area of large windows that are primarily for both daylight and exterior views.
 807 Typically, their placement in the wall is between 1 meter and 2.2 meter above the floor level.

808

809 **W**

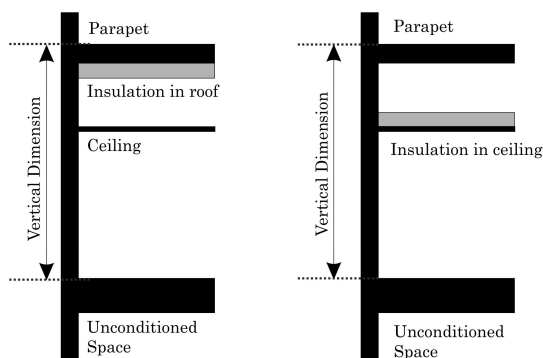

810 **Wall:** that portion of the building envelope, including opaque area and fenestration, that is vertical or tilted
 811 at an angle of 60° from horizontal or greater. This includes above- and below-grade walls, between floor
 812 spandrels, peripheral edges of floors, and foundation walls.

813 (a) Wall, above grade: a wall that is not below grade.

814 (b) Wall, below grade: that portion of a wall in the building envelope that is entirely below the finish
 815 grade and in contact with the ground.

816 **Wall area, gross:** the overall area off a wall including openings such as windows and doors measured
 817 horizontally from outside surface to outside surface and measured vertically from the top of the floor to
 818 the top of the roof. If roof insulation is installed at the ceiling level rather than the roof, then the vertical
 819 measurement is made to the top of the ceiling. The gross wall area includes the area between the ceiling
 820 and the floor for multi-story buildings.

821

822

- 823 **Water heater:** vessel in which water is heated and withdrawn for use external to the system.
- 824 **Wastewater:** Used water from plumbing fixtures or similar equipment which may be a source of black or
825 grey water.
- 826 **Wet Area:** Areas such as bathroom, toilet, kitchen and laundry where water is utilized at fixtures and
827 appliances.
- 828 **White Light Source:** electrically operated product intended to emit, or, in the case of a non-incandescent
829 light source, intended to be possibly tuned to emit, light, or both, with the following optical characteristics:
- 830 Chromaticity coordinates x and y in the range $0.270 < x < 0.530$ and
831 $2.3172 x^2 + 2.3653 x - 0.2199 < y < -2.3172 x^2 + 2.3653 x - 0.1595$
- 832 **Z**
- 833 **Zone, HVAC:** a space or group of spaces within a building with heating and cooling requirements that are
834 sufficiently similar so that desired conditions (e.g., temperature) can be maintained throughout using a
835 single sensor (e.g., thermostat or temperature sensor).
- 836 **Zone, Critical:** a zone serving a process where reset of the zone temperature set point during a demand
837 shed event might disrupt the process, including but not limited to data centers, telecom and private branch
838 exchange (PBX) rooms, and laboratories.
- 839 **Zone, Non-Critical:** a zone that is not a critical zone.
- 840 **Zone, Plumbing:** A group of 8-10 adjacent floors categorized as zone for a pumping system.
- 841

850

ECSBC – SUSTAINABLE SITES & PLANNING

851

DRAFT FOR STAKEHOLDER CONSULTATION

852

853

SUSTAINABLE SITES & PLANNING

854

4.1 General Requirement

856 The Sustainable Sites and Planning section of the code is about preserving ecology and reducing
857 environmental impacts due to construction activities. It focuses on restoring and preserving the
858 biodiversity of the site caused or likely to cause due to development.

859 The buildings shall comply with the mandatory requirements as specified in 4.2.1 to 4.2.5. The prescriptive
860 requirements are specified in 4.3.1 to 4.3.7. The compliance level for ECSBC, ECSBC plus and ECSBC Super
861 shall be as per table 4.1. Relevant conformance documents shall be submitted for verification purposes as
862 detailed in section 4.4.

863

Table 4.1: Compliance requirements for ECSBC, ECSBC + and Super ECSBC

| Compliance Level | No of Prescriptive Measures Implemented |
|------------------|--|
| ECSBC | All Mandatory Requirements |
| ECSBC + | Mandatory Requirements and Prescriptive Measures - 4.3.1, 4.3.2, 4.3.3 |
| Super ECSBC | Mandatory Requirements and Prescriptive Measures - 4.3.1 to 4.3.7 |

864

4.2 Mandatory Requirements

865

4.2.1 Topsoil Preservation

866 Top soil is a critical resource for the existence of species of all kinds. Soil erosion occurs due to storms and
867 wind during construction and post-construction activities. The topsoil is nutrient rich and takes centuries
868 to become fertile. Therefore, adequate steps need to be taken to preserve the top soil. Topsoil testing shall
869 be carried out to verify and ensure the fertility of the soil as per Table 4.2 given below:

870

Table 4.2: Topsoil requirements

| S.NO | PARAMETER | UNIT | NORMAL RANGE |
|------|-----------------------|-------|--------------|
| 1 | pH | - | 6.5 – 7.5 |
| 2 | Available NITROGEN | Kg/ha | 125-180 ppm |
| 3 | Available PHOSPHOROUS | Kg/ha | 5-10 ppm |
| 4 | Available POTASSIUM | Kg/ha | 62-125 m |

871

Source: Paper published by Indian Institute of Horticultural Research (IIHR)

872 **4.2.2 Selection of site**

873 The site plan must comply with the local byelaws with regard to development plan and master plan and
874 Urban Development Plans Formulation and Implementation (UDPFI) guidelines & regulations for eco-
875 sensitive zones, coastal zones, heritage areas, water body zones, hazard-prone areas and others.

876 **4.2.3 Design for Differently Abled**

877 *Ramps*

878
879 Provide minimum one accessible entrance with provision of ramp. Ramps shall conform to NBC 2016 – Part
880 3, Annexure B-6.2.2, Table 10 minimum width and minimum gradient requirements.

881
882 *Elevators*

883
884 In Multi-storied buildings provide at least one elevator that shall conform to NBC 2016 – Part 3, Annexure
885 B-6.4, accessible to persons with disabilities at all usable levels.

886
887 The elevator opening shall be 0.9 m minimum. audio and braille assistance shall be provided in lifts for
888 visually impaired people.

889
890 *Washroom*

891
892 Minimum one restroom in the building common areas shall be designed for differently abled people or as
893 defined by the local byelaw, in an easily accessible location.

- 894
895 a) Provide minimum one unisex wheelchair user accessible restroom that shall conform to NBC
896 2016 – Part 3, Annexure B-9.2.2, with central placement of water closet and provision of
897 washbasin.
898 b) Depending on footfall, provide additional accessible toilets in male and female restroom that
899 shall conform to NBC 2016 – Part 3, Annexure B-9.2.3
900 c) The floors surfaces shall be slip resistant, anti-glare and firm.
901 d) Signages at entrance of accessible toilets shall conform to NBC 2016 – Part 3, Annexure B-9.18.

902 **4.2.4 Heat Island Reduction – Non-Roof Areas**

903 Paved areas including uncovered parking areas and pathways of the site shall not exceed 30% of the total
904 site area excluding building footprint or as per local bye law, whichever is more stringent.

905 **4.2.5 Brownfield Remediation**

906 If applicable, brownfield sites for construction of commercial buildings shall be used only after proper
907 remediation. Remediation techniques shall include but not limited to pump-and-treat, bioreactors, land
908 farming and in-situ remediation.

909 NOTE: The remediation measures shall be as per local bye laws. Post remediation, the site shall be
910 approved by local statutory body for its intended use.

911

912 **4.3 Prescriptive Requirements**

913 **4.3.1 Topsoil preservation**

914 Projects shall address the following topsoil preservation measures.

915 a) Pre-Construction Measures

916 Fertile topsoil shall be preserved for at least for 0.15m to 0.2m and reused on site for landscaping or
917 donated to a nursery.

918 b) During Construction Measures

919 A sedimentation basin shall be installed at the exit of storm water from site, to avoid topsoil erosion
920 during construction.

921 **4.3.2 Dedicated Parking for Differently Abled**

922 Differently abled people should be provided with preferential parking as per NBC 2016 – Part 3, Annexure
923 B-3.5:

- 924 a) One differently abled car park shall be provided for the first 100 parking spaces, additional differently
925 abled car park for every 250 parking spaces thereafter.
- 926 b) Dedicated parking shall be accessible within 30m of the main entrance.
- 927 c) Signages shall be installed for dedicated differently abled parking at a minimum height of 2.1 m.
- 928 d) International symbol of accessibility shall be painted on floor surface as per NBC 2016 -Part 3,
929 Annexure B-3.3.

930 **4.3.3 Access for Differently Abled**

931 Access to the building for differently abled people shall be designed as per NBC 2016 – Part 3, Annexure B-
932 5.3:

- 933 a) Width of the entrance door shall be minimum 0.9 m.
- 934 b) Tactile warning blocks shall be provided at 0.3 m from the entrance.

935 **4.3.4 Access to Amenities**

936 Access to at least four amenities shall be provided from the list below, either within the building or within
937 a walking distance of 800 m from the building entrance. These facilities shall be available once the
938 building is operational.

- 939 a) Automated Teller Machine (ATM) / Bank
- 940 b) Health care Clinic / Hospital
- 941 c) Crèche
- 942 d) Pharmacy
- 943 e) Restaurant / Cafeteria
- 944 f) Fitness center / Gym

945 **4.3.5 Access to Public Transportation**

- 946 a) The project shall have access to a public transportation by road, or rail or water within 800 m
947 walking distance from project exit gate, (or)
- 948 b) Wherever public transport is not available within 800m walking distance, transport service to
949 the nearest public transport facility to cater to at least 25% of the building occupants shall be
950 provided.

951 **4.3.6 In-situ transit**

952 If applicable, buildings in large campuses with total ground area above 1,00,000 sq m should provide the
953 following:

- 954 a) Bicycle lane network for internal commuting to connect all main buildings.
 955 b) Bicycle parking facility for all main buildings within 100 m of walking distance from entrance
 956 to cater to 10% of the occupants.

957 **4.3.7 Heat Island Reduction – Roof Areas**

958 Urban Heat Island effect shall be minimized by providing cool roof or vegetation for 95% of the net
 959 exposed roof area as specified in chapter 4B (Building Envelope)

960 **4.3.8 Heat Island Reduction – Non-Roof Areas**

961 Shade shall be provided for 100% of paved area including uncovered parking area and pathways either
 962 through vegetation or a combination of vegetation, structural shade with high-reflective materials and
 963 open grid paver blocks. The structural roof shall meet the cool roof criteria of minimum SRI of 82. High
 964 reflective materials provided in non-roof areas shall have SRI of at least 29 and not greater than 64.
 965

966 **4.4 Documentation Requirements**

967 Documents requirements to verify the compliance shall be as per table 4.5.1 and 4.5.2.
 968

969 **4.4.1 Documents requirement for mandatory requirements compliance**

970 Table 4.5.1 Documents requirements for Mandatory sections compliance.

| Section | Section Name | Documents to submit |
|---------|--|--|
| 4.2.1 | Topsoil preservation | Submit Topsoil test report |
| 4.2.2 | Selection of site | Demonstrate that the design considered is as per local bye law /UDPFI guidelines. |
| 4.2.3 | Design for Differently Abled | Submit parking drawings and photographs Submit drawings, photographs and manufacturer datasheet of elevators Submit drawings and photographs of differently abled washroom |
| 4.2.4 | Heat Island Reduction – Non-Roof Areas | Submit calculations and site plan showing the paved areas |
| 4.2.5 | Brownfield Remediation | Submit documentation of remediation measures adopted and clearance certificate from local statutory body . |

971 **4.4.2 Documents requirement for prescriptive requirements compliance**

972 Table 4.5.1 Documents requirements for Prescriptive sections compliance.

| Section | Section Name | Documents to submit |
|---------|---|--|
| 4.3.1 | Topsoil Preservation | Drawings and narratives highlighting topsoil preservation measures shall be submitted. Demonstrate through calculations, photographs & acknowledgement from the receiving beneficiary with regard to quantity of topsoil donated. |
| 4.3.2 | Dedicated Parking for Differently Abled | Submit parking drawings and photographs to demonstrate compliance. |
| 4.3.3 | Access for Differently Abled | Submit drawings highlighting the provisions for accessibility of differently abled. |
| 4.3.4 | Access to Amenities | Site map or drawing showing walking access to amenities shall be submitted. |
| 4.3.5 | Access to Public Transportation | Site map showing the access to amenities shall be submitted. Alternatively, letter indicating if contract would be in place for transportation services commuting shall be submitted. |
| 4.3.6 | In-Situ Transit | Site plan indicating the bicycle network and bicycle parking shall be submitted. Calculations for the number of bicycle parking provided. |
| 4.3.7 | Heat Island Reduction – Roof Areas | Submit roof plan demonstrating compliance. A test report from an NABL accredited lab shall be submitted for compliance to SRI value of the cool roof |
| 4.3.8 | Heat Island Reduction – Non Roof Areas | Site plan indicating the paved areas and measures adopted to reduce heat island reduction along with calculations shall be submitted. Manufacturer data sheets indicating the SRI value of the paving material shall be submitted or shall use type 1 eco-labelled products. |

973

974

975

976

Section 4 B

977

ECSBC – BUILDING ENVELOPE

978

DRAFT FOR STAKEHOLDER CONSULTATION

979 **4B BUILDING ENVELOPE**

980 **4B 1. GENERAL REQUIREMENTS**

981 The building envelope shall comply with the mandatory requirements as specified in 4B 2, and the
982 prescriptive criteria as specified in §4B 3.

983 **4B 2. MANDATORY REQUIREMENTS**

984 **4B2.1 Fenestration**

985 *4B.2.1.1 U-Factor*

986 U-factors shall be determined for the overall fenestration product (including the sash and frame) in
987 accordance with ISO-15099 by an accredited independent laboratory, and labelled by the manufacturer.
988 U-factors for sloped glazing and skylights shall be determined at a slope of 20 degrees above the horizontal.
989 For unrated products, see the default value given in Appendix A of chapter 10.

990 *4B.2.1.2 Solar Heat Gain Coefficient (SHGC)*

991 SHGC shall be determined for the overall single or multi glazed fenestration product (including the sash
992 and frame) in accordance with ISO-15099 by an accredited independent laboratory, and labelled or
993 certified by the manufacturer.

994 Notes:

995 Exceptions to 4B.2.1.2:

- 996 (a) Shading coefficient (SC) of the centre of glass alone multiplied by 0.86 is an acceptable alternate for compliance
997 with the SHGC requirements for the overall fenestration area.
998
999 (b) Solar heat gain coefficient (SHGC) of the glass alone is an acceptable alternate for compliance with the SHGC
1000 requirements for the overall fenestration product.

1001 *4B.2.1.3 Visible light transmittance (VLT)*

1002 Visible light transmittance (VLT) shall be determined for the fenestration product in accordance with ISO-
1003 15099 by an accredited independent laboratory, and labelled by the manufacturer. For unrated products,
1004 VLT of the glass alone shall be derated by 10% for demonstrating compliance with the VLT requirements
1005 for the overall fenestration product.

1006 **4B 2.2 Opaque Construction**

1007 *4B2.2.1 U-Factor*

1008 U-factors shall be calculated for the opaque construction in accordance with ISO-6946. Testing shall be
1009 done in accordance with approved ISO Standard for respective insulation type by an accredited
1010 independent laboratory, and labelled or certified by the manufacturer. For unrated products, use the
1011 default tables in Appendix A.

1012 **4B2.2.2 Solar Reflectance**

1013 Solar reflectance for the external opaque roof construction material shall be determined in accordance
1014 with ASTM E903-96 by an accredited independent laboratory and labelled by the manufacturer.

1015 **4B2.2.3 Emittance**

1016 Emittance for the external opaque roof construction shall be determined in accordance with ASTM E408-
1017 71 (RA 2008) by an accredited independent laboratory, and labelled by the manufacturer.

1018 **4B 2.3 Daylighting and Visual Comfort**

1019 Compliance for daylighting may be demonstrated either with simulation using the Useful Daylight
1020 Simulation compliance path as defined in clause 4B 2.3.1 or through the Spatial Daylight Autonomy Part as
1021 defined in clause 4B 2.3.4. Compliance may also be demonstrated as per manual method in 4B.2.3.3. For
1022 Whole Building simulation, the standard building shall be modelled with daylight sensors located within
1023 6m from the building periphery.

1024 **4B 2.3.1 Useful daylight illuminance**

1025 Above grade floor areas shall meet the useful daylight illuminance (UDI) area requirements listed in Table
1026 4B-0-1 for 90% of the potential daylight time in a year.

1027 Exceptions to 4B.2.3

1028 Assembly buildings and other buildings where daylighting will interfere with the functions of 50% (or more)
1029 of the building floor area, are exempted from meeting the requirements listed in Table 4B-0-1.

1030 *Table 4B-0-1 Daylight Requirement*

| <i>Building Category</i> | <i>Percentage of above grade floor area meeting the UDI requirement</i> | | |
|---|---|---------------|--------------------|
| | <i>ECSBC</i> | <i>ECSBC+</i> | <i>Super ECSBC</i> |
| Business, Educational | 40% | 50% | 60% |
| No Star Hotel Star Hotel Healthcare | 30% | 40% | 50% |
| Resort | 45% | 55% | 65% |
| Shopping Complex | 10% | 15% | 20% |
| Assembly | Exempted | | |

1031

1032

1033 **4B.2.3.2 Useful Daylight Illumination (UDI) Simulation Method**

1034 A software validated by an appropriate authority and approved by BEE shall be used to demonstrate
 1035 compliance through the UDI simulation method. Buildings shall achieve illuminance level between 100
 1036 lux and 2,000 lux for the minimum percentage of floor area prescribed in Table 4B-0-1 for at least 90%
 1037 of the potential daylight time.

1038 UDI>2000 lux will be used as a metric to evaluate glare impact in buildings. UDI>2000 lux shall be less than 5%
 1039 of the floor area when UDI method of evaluation is used for Daylight compliance.

1040 Illuminance levels for all spaces enclosed by permanent internal partitions (opaque, translucent, or
 1041 transparent) with height greater or equal to 2 m from the finished floor, shall be measured as follows:

- 1042 a. Measurements shall be taken at a work plane height of 0.8 m above the finished floor. The period of analysis
 1043 shall be fixed for continuously minimum 6 hours per day or working daylight hours (whichever is more),
 1044 between 7:00 AM to 5:00 PM, resulting in maximum 2,920 hours in total for all building types.
 1045
- 1046 b. Available useful daylight across a space shall be measured based on point-by-point grid values. UDI shall
 1047 be calculated for at least one point for each square meter of floor area.
 1048
- 1049 c. Fenestration shall be modelled with actual visible light transmission (VLT) as per the details provided in the
 1050 material specification sheet.
 1051
- 1052 d. All surrounding natural or man-made daylight obstructions shall be modelled if the distance between the
 1053 façade of the building (for which compliance is shown) and surrounding natural or man-made daylight
 1054 obstructions is less than or equal to twice the height of the man-made or natural sunlight obstructers. If
 1055 the reflectance of the surfaces is not known, default reflectance of 30% and 0% shall be used for all vertical
 1056 surfaces of man-made and natural obstructers respectively.
 1057
- 1058 e. Interior surface reflectance shall be modelled based on the actual material specification. If material
 1059 specification is not available, the default values in Table 4B-0- shall be used.
- 1060 f. Documentation requirement to demonstrate compliance are:
 1061
 - 1062 i. Brief description of the project with location, number of stories, space types, hours of operation and
 1063 software used.
 - 1064 ii. Summary describing the results of the analysis and output file from simulation tool outlining
 1065 point wise compliance for the analysis grid and compliance in percentage.
 - 1066 iii. Explanation of any significant modelling assumptions made.
 - 1067 iv. Explanation of any error messages noted in the simulation program output.
 - 1068 v. Building floor plans, building elevations & sections, and site plan with surrounding building details (if
 1069 modelled).
 - 1070 vi. Material reflectance, analysis grid size, total number of grid size/resolution, total number of
 1071 grid points.

1072 *Table 4B-0-2 Default Values for Surface Reflectance*

| <i>Surface Type</i> | <i>Reflectance</i> |
|------------------------------------|--------------------|
| Wall or Vertical Internal Surfaces | 50% |
| Ceiling | 70% |
| Floor | 20% |

| | | |
|------|-----------------------|-----|
| 1073 | Furniture (permanent) | 50% |
|------|-----------------------|-----|

4B.2.3.2

1074
1075 **Spatial Daylight Autonomy (sDA) Method:**

1076 Above grade floor areas shall meet or exceed the Spatial Daylight Autonomy and listed in Table 4B-0-
1077 1 for occupied daytime hours (minimum 6 hours). Mixed-use buildings shall show compliance as per
1078 the criteria prescribed in §4B.2.3.2.1. Assembly buildings (auditoriums, community halls, museums
1079 etc.) and other buildings where daylighting will interfere with the functions or processes of 50% (or
1080 more) of the building floor area, are exempted from meeting the requirements listed in Table 4B-0-1.
1081 All values in the Table 4B-0-3 below are for ASE1000,250h**.

1082 Note that annual sunlight exposure of 1000 lux,250hrs (ASE1000,250) shall be of no more than 10% of
1083 the space floor area.

1084 *Table 4B-0-3 SDA requirement*

| Building Category | Percentage of above grade floor area meeting the SDA-requirement | | |
|---|--|-------------|-------------|
| | ECSBC | ECSBC+ | Super ECSBC |
| Business, Educational | sDA300,40%. | sDA300,50%. | sDA300,60% |
| No Star Hotel Star Hotel Healthcare | sDA300,30%. | sDA300,40%. | sDA300,50%. |
| Resort | sDA300,45%. | sDA300,55%. | sDA300,65%. |
| Shopping Complex | sDA300,10%. | sDA300,15%. | sDA300,20%. |
| Assembly | Exempted | | |

1085
1086 **NOTE:**
1087 1) The 'Illuminating Engineering Society' (IES) has developed the sDA which is defined in the standard IES LM-83-12

1088 Spatial Daylight Autonomy (sDA) is a metric describing annual sufficiency of ambient daylight levels in interior
1089 environments. It is defined as the 'percent of an analysis area' (the area where calculations are performed -typically
1090 across an entire space) that meets a minimum daylight illuminance level for a specified fraction of the operating hours
1091 per year. E.g., The illuminance level and time fraction are included as subscripts, as in sDA300,50%.

1092 2) ASE is defined by the IES LM-83-12 standard as a metric that describes the potential for visual discomfort in interior
1093 work environments. It is defined as the percent of an analysis area that exceeds a specified direct sunlight illuminance
1094 level more than a specified number of hours per year.

1095 ASE is used in conjunction with sDA to determine the viability of daylighting. The recommended settings for ASE analysis
1096 determine the area exposed to more than 1000 lux of direct sunlight for more than 250 hours per year (ASE1000,250h),
1097 before any operable blinds or shades are deployed to block sunlight, considering the same min. 7 hour/day or working
1098 daylit hours analysis period as sDA and using comparable simulation methods.

1099 **4B.2.3.2.2 Spatial Daylight Autonomy Simulation Method**

1100 A software validated by an appropriate authority and approved by BEE shall be used to demonstrate
1101 compliance through the daylighting simulation method.

1102 The geometry of the space which includes flooring walls, fenestration etc. must be accurately
1103 modelled, with respect to the true solar north. Any angles in the wall/roof etc. also need to be
1104 accurately modelled. The reflectance of the wall, floor and ceiling need to be accurately modelled.

1105 **4B.2.3.2.2.1 Analysis Area**

1106 sDA measures daylight sufficiency across a space based on point-by-point values and can be applied to an
1107 analysis grid of any size or shape. The output is presented as the percentage of analysis points that meet
1108 the stated criteria. Therefore, output can be interpreted space by space, accumulated across several spaces
1109 or addressed throughout an entire building.

1110 To report results for an entire building at once, simply accumulate all measurement points for all defined
1111 analysis grids and report the area that meets the criteria.

1112 Within the analysis areas measurement points shall be continuous, on a 1000 mm grid from the walls at a
1113 height of 750mm from the finished floor level. Grid points that fall within any opaque furniture such as
1114 cabinets may be excluded from the calculations.

1115 **4B.2.3.2.2.2 Period of Analysis:**

1116 Consider a time period of 6 hours or number of working daylight hours (which is more) from 8am to 6pm for
1117 this period.

1118 **4B.2.3.2.2.3 Blinds/Shades Operation:**

1119 All exterior windows should be modelled with interior blinds or shades that close in order to block direct
1120 sunlight on an hourly basis by “window group”, such that no more than a specified number of analysis
1121 points within an analysis area are ever in direct sunlight.

1122 All exterior windows must be modelled with blinds unless:

- 1123 a) Blinds are not be installed according to design documents.
- 1124 b) The Annual Sunlight Exposure calculation for the analysis area associated with the window group
1125 meets or exceeds the recommended criteria for “nominally acceptable” (neutral) comfort.

1126 **4B.2.3.2.2.4 Blinds/Shades Optical Properties:**

1127 Use Bidirectional Scattering Distributing Function (BSDF) or geometric model data (e.g., of louver blinds) if
1128 available to define the specular and diffuse distribution of any blind or shade material. The angle of blinds,
1129 or the position of shades, shall be assumed to be set to block direct sunlight from the lowest solar angle
1130 experienced for that façade orientation for a given calendar month at that location, based on the nearest
1131 Typical meteorological year (TMY) weather file for the analysis period.

1132 If BSDF data cannot be used, and the windows have fabric shades or curtains, model the shades using a
1133 combination of specular and diffuse transmittance

1134 The specular transmittance should be equal to the openness factor of the fabric class 7, while the diffuse
1135 transmittance should be the total visible light transmission (VLT) minus the openness factor:

- 1136 a) If VLT is known & the Openness factor is not known - Model the VLT with no specular Transmittance.

- 1137 b) If the shade VLT is unknown - model the shade using 5 percentage diffuse VLT with no specular
1138 transmittance.
1139 c) If BSDF data cannot be used, and the windows have white louver blinds (>80% reflectance - use a
1140 20% VLT diffuse distribution for both sunlight and skylight

1141 The VLT of darker blind colours shall be depreciated proportionally, to a lower limit of 10% diffuse VLT for
1142 black blinds (reflectance of 0%) for both sunlight and skylight. Blinds with 40% Reflectance to be modelled
1143 at 15% VLT and Blind with 60% Reflectance to be modelled ta 17.5% VLT.

1144 **4B.2.3.2.2.5 Exterior Obstructions**

1145 Exterior obstructions shall be modelled using at least the minimum level of detail described below.

1146 (a) Model all buildings and opaque structures within at least 30m of the spaces under study,
1147 including any surfaces of the modeled building itself. Such exterior obstructions shall be
1148 modelled with at least a resolution of 3m increments in dimensions.

- 1149
1150 i. More robust exterior obstruction modelling is permissible.
1151 ii. If the reflectance of surfaces is not known, assume 30% reflectance for all vertical
1152 surfaces.
1153 iii. If exterior obstructions are not known, assume adjacent buildings of equal height to
1154 the study building set on adjoining parcels, with a setback equal to the study building.
1155

1156 (b) Model trees as appropriately sized cones, spheres, or cylinders with 20% reflective
1157 component. More accurate shapes are allowable.

1158
1159 (c) Use actual surface reflectance values for ground surfaces within a minimum of 30m from the
1160 building perimeter. A default reflectance of 10% may be used if reflectance is unknown.

1161 **4B.2.3.2.2.6 Windows and Skylight Details**

1162 Window and skylight glazing shall be modelled with actual visible light transmittance (VLT), less a dirt
1163 depreciation factor.

1164 Window openings should be modelled in three dimensions. When not known, other framing elements can
1165 be modelled as a percent reduction in glazing VLT relative to a rough opening area.

1166 Skylight openings should be modelled in three dimensions, including at a minimum the vertical offset
1167 between skylight glazing and ceiling surface, otherwise known as the skylight well.

1168 (a) Fenestration glazing VLT shall be based on site measured data for existing buildings, or
1169 manufacturer's product information for new construction, to within 5% accuracy.

1170
1171 (b) Any window detail (sills, jambs, mullions, etc.) greater than 50mm in any dimension shall
1172 be modelled as such.

1173
1174 (c) All overhangs, light shelves, and other light redirecting elements shall be modelled with
1175 accurate geometry and material properties.

1176
1177 (d) All windows shall be modelled with actual wall thicknesses and sill and jamb reflectance.
1178

1179 (e) All skylights shall be modelled as three-dimensional elements, using actual dimensions,
1180 geometry, VLT and reflectance.

1181
1182 (f) The fenestration surfaces must be properly oriented with respect to vertical and true solar
1183 north within the model.

1184 **4B.2.3.2.2.7 Interior Surface Reflectance**

1185 Interior surface reflectance shall be modelled based on information from field measurements, construction
1186 specifications, or if not known, use Table 4B 02

1187 **4B.2.3.2.2.8 Furniture and Partitions**

1188 Furniture and opaque interior partitions shall be modelled.

1189 **4B.2.3.2.2.9 Documentation requirement to demonstrate compliance**

1190

1191 a. Brief description of the project with location, number of stories, space types, hours of operation and
1192 software used.

1193
1194 b. Summary describing the results of the analysis and output file from simulation tool outlining point
1195 wise compliance for the analysis grid and compliance in percentage.

1196
1197 c. Explanation of any significant modelling assumptions made.

1198
1199 d. Explanation of any error messages noted in the simulation program output.

1200
1201 e. Building floor plans, building elevations and sections, and site plan with surrounding building details
1202 (if modelled).

1203
1204 f. Details of building obstructions (if modelled).

1205
1206 g. Details of optical properties of exterior/interior blinds shades modelled.

1207
1208 h. Material reflectance, analysis grid size, total number of grid size/resolution, total number of grid
1209 points

1210 **4B.2.3.3 Manual Daylighting Compliance Method**

1211 All above grade floor areas shall meet or exceed the Daylight Factor requirements as described in
1212 section 4B 2.3.3.1 and;

1213 All external Fenestrations should meet Shading requirements as described in Table 4B-0-4C 4B 2.3.1.2

1214 **4B.2.3.3.1 Daylight Factor Calculation**

1215

1216 This method can be used for demonstrating compliance with daylighting requirements without simulation.

1217 Daylight factors (DF) shall be used for manually calculating percentage of above grade floor area meeting
1218 the daylight requirement as per Table 4B-0-4A. Spaces such as auditoriums, cinemas, where daylighting
1219 will interfere with the functions or processes can be exempted from the calculation of the building floor

1220 area. Utility spaces such as stores, AHUs, server rooms, toilets can also be exempted from the calculation
 1221 of the building floor area.

1222

1223

1224 *Table 4B-0-4A Percentage of Total floor area meeting DF Requirement*

| <i>Building Category</i> | <i>Percentage of total floor area meeting DF requirements</i> | | |
|---|---|--------|------------|
| | ECSBC | ECSBC+ | SuperECSBC |
| Business, Educational | 40% | 50% | 60% |
| No Star Hotel Star Hotel Healthcare | 30% | 40% | 50% |
| Resort | 45% | 55% | 65% |
| Shopping Complex | 10% | 15% | 20% |

1225

1226 Daylight factor (DF) is a measure of all the daylight reaching on an indoor reference point from the
 1227 following sources:

- 1228 (a) The direct sky visible from the point,
- 1229 (b) External surfaces reflecting light directly to the point, and
- 1230 (c) Internal surfaces reflecting and inter-reflecting light to the point.

1231 *Table 4B-0-4B Daylight Factors (DF) to be met in each space*

| <i>Location</i> | <i>Daylight factor (%)</i> |
|-----------------|----------------------------|
| <i>Schools</i> | |
| Classroom | 1.9 |
| Lecture hall | 2.0 to 2.5 |
| Study hall | 2.0 to 2.5 |
| Labs | 1.9 to 3.8 |
| <i>Offices</i> | |
| General | 1.9 |
| Drawing | 3.75 |

| | |
|-----------------------------------|--------------|
| Enquiry | 0.63 to 1.9 |
| <i>Hospitals</i> | |
| General wards and inpatient rooms | 1.25 |
| Labs | 2.54 to 3.75 |
| <i>Libraries</i> | |
| Stack rooms | 0.9 to 1.9 |
| Reading rooms | 1.9 to 3.75 |
| Counter areas | 2.5 to 3.75 |
| Catalogue rooms | 1.9 to 2.5 |
| <i>Hotels</i> | |
| Bedrooms | 0.625 |
| Lobbies and Dining | 1.9 |
| Kitchen | 2.5 |
| Circulation | 0.3 |

1232 Source: (Bureau of Indian Standards, 1989)

1233

1234 Daylight Factor Calculations are as described in CIBSE Lighting Guide 10 (1999)

1235

1236 Example : An office building located in New Delhi, India is pursuing ECSBC compliance. Visible light transmission (VLT) of glazing in all orientations is 0.5. Windows have external shading devices with 0.45m along the North and 0.9mm along the south facade. Head height of fenestrations is 2.0 m with sill at 0.9m. Ceiling height is 3.5m.

1237

1238

1239

1240 Step 1: Calculate the floor area for each space.

1241 Step 2: Note the glass transmittance for the window in each room

1242 Step 3: Calculate the Net glazed area in the room.

1243 Step 4: Calculated the angle subtended by the visible sky at the centre of the room at a height of 0.75m
 1244 from the floor.

1245

1246 Step 4: Calculated the total surface area including the walls, floor, ceiling, and windows.

1247 Step 5: Calculate the area weighted average reflectance for all surface.

1248 Step 6: Calculate the Daylight factor with the formula: $DF = (T \cdot A_w \cdot Q) / (A \{1 - R^2\})$ and the percentage of
 1249 total area that meets the DF requirement to meet Manual compliance.

1250 **4B 2.3.1.1. 4B2.3.3.2 Shading Requirement Calculation**

1251 Shading should be provided as per Table 4B-0-4C thereby avoiding direct solar ingress during the hottest
 1252 part of the day.

1253 *Table 4B-0-4C Shading requirement*

| Latitude | Shading extent on Sun path |
|----------|--|
| ≥ 15°N | 10am to 3pm from March to September for all orientations |
| < 15°N | 10am to 3pm from February to November for all orientations |

1254

1255 Shading to be demonstrated as per 4B.2.3.3.3 below

1256 **4B 2.3.1.2. 4B.2.3.3.3 Shading calculations using Sun path and Shading**
 1257 **Protractor.**

1258

1259 (a) Shading study may be carried out manually, using a shading protractor or may be carried out using a
 1260 BEE approved simulation software

1261 (b) The solar protractor with shading mask should be overlapped with the sun path to show the
 1262 requirement of shading is met.

1263 (c) Shading mask should be taken at the centre of the fenestration at the sill level (Point of reference) in
 1264 case of simple shading geometry (Overhang and vertical fins). Multiple shading mask for a single

1265 fenestration should be provided at the centre and the corners of the fenestration at the sill level in
1266 case of complex shading geometry.

1267 (d) Surrounding man-made or natural objects which will impact shading of the fenestration should be
1268 included in the Shading study.

1269 (e) Documentation requirement:

1270 i. A separate architectural plan shall be prepared with all areas meeting the daylight factor marked on the floor
1271 plans.

1272 ii. A summary report shall be provided showing compliance.

1273 iii. Report on the shading study compiled for each unique fenestration on each orientation.

1274

1275 4B.2.4 Building Envelope Sealing

1276 Following areas of the building envelope, of all except naturally ventilated buildings or spaces, shall be
1277 sealed, caulked, gasketed, or weather-stripped:

1278 (c) Joints around fenestration, skylights, and door frames

1279 (d) Openings between walls and foundations, and between walls and roof, and wall panels

1280 (e) Openings at penetrations of utility services through roofs, walls, and floors

1281 (f) Site-built fenestration and doors

1282 (g) Building assemblies used as ducts or plenums

1283 (h) All other openings in the building envelope

1284 (i) Exhaust fans shall be fitted with a sealing device such as a self-closing damper

1285 (j) Operable fenestration should be constructed to eliminate air leakages from fenestration frame and
1286 shutter frame

1287

1288

Note 4B.1 Daylight Extent Factor and Useful Daylight Illuminance

Useful Daylight Illuminance (UDI) is defined as the annual occurrence of daylight between 100 lux to 2,000 lux on a work plane. This daylight is most useful to occupants, glare free and when available, eliminates the need for artificial lighting. Daylight extent factor provides a ratio of window sizes to floor area receiving UDI in accordance to window orientation.

Calculating Useful Daylight Illuminance (UDI)

An office building located in New Delhi, India is pursuing ECSBC compliance. Table 4B-0-1 lists the minimum daylight area requirements for compliance. The table specifies that for office buildings, minimum 40% of its floor area shall receive daylight in range of 100 – 2,000 lux for at least 90% of the year.

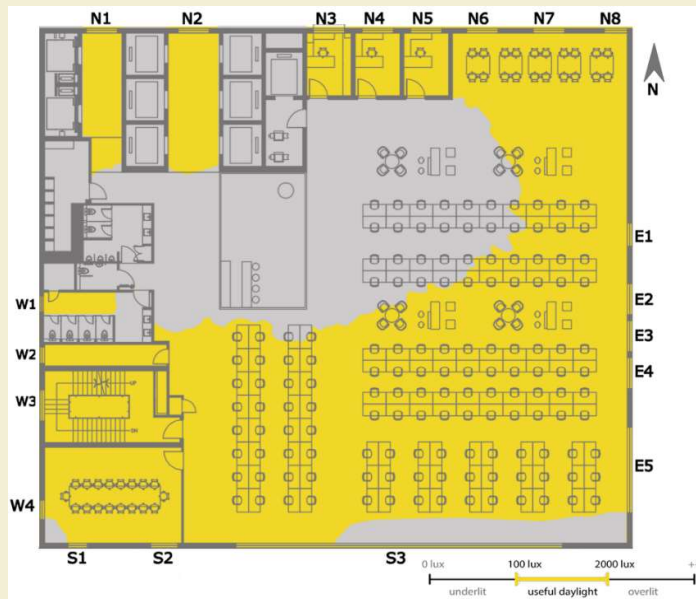

This typical floor has a rectangular layout (33 m x 38 m) of 1,254 m². Visible light transmission (VLT) of glazing in all orientations is 0.39. Windows have light shelves and external shading devices with Projection Factor (PF) ≥ 0.4. Head height of fenestrations is 3.0 m.

For compliance at least 502 m² (40% of 1,254 m²) of floor area shall fulfil the UDI requirements. Daylit area should be indicated in floor plans submitted to code enforcement authorities. Design guidelines on daylighting stated in NBC (Part 8: Building Services, Section 1: Lighting and Natural Ventilation, Subsection 4.2: Daylighting) should also be referred to achieve the ECSBC, ECSBC+, or Super ECSBC requirement. Compliance with 4.2.3 Daylight Requirements can be checked for through two approaches.

(a) Analysis through software

If the whole building performance approach is used, compliance for daylighting requirements can be checked by analyzing the façade and floor plate design in an analytical software approved by BEE (3.4). The image below, developed through an approved software, specifies the lux levels and time-period of a year during which lighting levels would be available. With this information, designers can check if the required minimum area as per 4.2.3 has the required daylight levels

UDI Analysis with a Daylighting Analysis Software

4B.2.5 Shading calculations using Sunpath and Shading Protractor.

Calculation methodology

- a. Shading mask study can be done manually over a solar shading protractor or can be done using any BEE certified simulation software.
- b. The solar protractor with shading mask should be overlapped with the sun path to show the requirement of shading is met.
- c. Shading mask should be taken at the centre of the fenestration (Point of reference) in case of simple shading geometry (Overhang and vertical fins). Multiple shading mask for a single fenestration should be provided at the centre and the corners of the fenestration in case of complex shading geometry.
- d. Surrounding Man-made or natural objects which will impact shading of the fenestration should be included in the Shading mask study.
- e. The Horizontal shading angle (HSA) is marked as horizontal shading angle of the shading device with the point of reference. Vertical shading angle (VSA) is marked as the angle made by the Shading device with the point of reference. Both should be marked on the Shading mask, whichever is applicable for the given case.

1289

1290

1291 **4B 3. Prescriptive Requirements**

1292 **4B.3.1 Roof**

1293 Roofs may comply with the maximum assembly U-factors in Table 4B- 0- through Table 4B-0-. The roof
 1294 insulation shall be applied externally as part of the roof assembly and not as a part of false ceiling.

1295 *Table 4B- 0-5 Roof Assembly U-factor (W/m².K) Requirements for ECSBC Compliant Building*

| | <i>Composite</i> | <i>Hot and dry</i> | <i>Warm and humid</i> | <i>and Temperate</i> | <i>Cold</i> |
|---|------------------|--------------------|-----------------------|----------------------|-------------|
| All building types, except below | 0.26 | 0.26 | 0.26 | 0.26 | 0.20 |
| Assembly Hospitality > 10,000 m ² AGA | 0.20 | 0.20 | 0.20 | 0.20 | 0.20 |

1296 *Table 4B- 0-6 Roof Assembly U-factor (W/m².K) Requirements for ECSBC+ Compliant Building*

| | <i>Composite</i> | <i>Hot and dry</i> | <i>Warm and humid</i> | <i>and Temperate</i> | <i>Cold</i> |
|--------------------|------------------|--------------------|-----------------------|----------------------|-------------|
| All Building Types | 0.20 | 0.20 | 0.20 | 0.20 | 0.20 |

1297 *Table 4B-0-7 Roof Assembly U-factor (W/m².K) Requirements for SuperECSBC Building*

| | <i>Composite</i> | <i>Hot and dry</i> | <i>Warm and humid</i> | <i>and Temperate</i> | <i>Cold</i> |
|---------------------|------------------|--------------------|-----------------------|----------------------|-------------|
| All buildings types | 0.18 | 0.18 | 0.18 | 0.18 | 0.18 |

1298 **4B3.1.1 Vegetated and Cool Roof**

1299 All roofs that are not covered by solar photovoltaics, or solar hot water, or any other
 1300 renewable energy system, or utilities and services that render it unsuitable for the purpose,
 1301 shall be either cool roofs or vegetated roofs.

1302 (k) For qualifying as a cool roof, roofs with slopes less than 20° shall have an initial solar reflectance
 1303 of no less than 0.70 and an initial emittance no less than 0.75. Solar reflectance shall be
 1304 determined in accordance with ASTM E903-96 and emittance shall be determined in
 1305 accordance with ASTM E408-71 (RA 2008).

1306
 1307 For qualifying as a vegetated roof, roof areas shall be covered by living vegetation of >50 mm
 1308 high.

1309 **4B.3.2 Opaque External Wall**

1310 Opaque above grade external walls shall comply with the maximum assembly U-factors in Table 4B-
 1311 0- through Table 4B- 0-8.

1312 *Table 4B-0-8 Opaque Assembly Maximum U-factor (W/m².K) Requirements for a ECSBC compliant Building*

| | <i>Composite</i> | <i>Hot and dry</i> | <i>Warm and humid</i> | <i>and Temperate</i> | <i>Cold</i> |
|---|------------------|--------------------|-----------------------|----------------------|-------------|
| All building types, except below | 0.40 | 0.40 | 0.40 | 0.55 | 0.34 |
| No Star Hotel < 10,000 m ² AGA | 0.63 | 0.63 | 0.63 | 0.63 | 0.40 |
| Business < 10,000 m ² AGA | 0.63 | 0.63 | 0.63 | 0.63 | 0.40 |
| School <10,000 m ² AGA | 0.85 | 0.85 | 0.85 | 1.00 | 0.40 |

1313 *Table 4B- 0-9 Opaque Assembly Maximum U-factor (W/m².K) Requirements for ECSBC+ Compliant Building*

| | <i>Composite</i> | <i>Hot and dry</i> | <i>Warm humid</i> | <i>and Temperate</i> | <i>Cold</i> |
|---|------------------|--------------------|-------------------|----------------------|-------------|
| All building types, except below | 0.34 | 0.34 | 0.34 | 0.55 | 0.22 |
| No Star Hotel < 10,000 m ² AGA | 0.44 | 0.44 | 0.44 | 0.44 | 0.34 |
| Business < 10,000 m ² AGA | 0.44 | 0.44 | 0.44 | 0.55 | 0.34 |
| School <10,000 m ² AGA | 0.63 | 0.63 | 0.63 | 0.75 | 0.44 |

1314 *Table 4B- 0-10 Opaque Assembly Maximum U-factor (W/m².K) Requirements for Super ECSBC Building*

| | <i>Composite</i> | <i>Hot and dry</i> | <i>Warm humid</i> | <i>and Temperate</i> | <i>Cold</i> |
|--------------------|------------------|--------------------|-------------------|----------------------|-------------|
| All building types | 0.22 | 0.22 | 0.22 | 0.22 | 0.22 |

1315

1316 Note:

1317 Exceptions to §4B.3.2: Opaque external walls of an unconditioned building of No Star Hotel, Healthcare,
 1318 and School categories in all climatic zones, except for cold climatic zone, shall have a maximum assembly
 1319 U-factor of 0.8 W/m².K.

1320 **4B.3.3 Vertical Fenestration**

1321 For all climatic zones, vertical fenestration compliance requirements for all three energy efficiency levels,
 1322 i.e. ECSBC, ECSBC+, and Super ECSBC, shall comply with the following:

- 1323 a. Maximum allowable Window Wall Ratio (WWR) is 40% (applicable to buildings showing compliance using
 1324 the Prescriptive Method, including Building Envelope Trade-off Method)
- 1325 b. Minimum allowable Visible light transmittance (VLT) is 0.27
- 1326 c. Assembly U-factor shall be determined for the overall fenestration product (including the sash and frame)

1329 Vertical fenestration shall comply with the maximum Solar Heat Gain Coefficient (SHGC) and U-factor
 1330 requirements of Table 4B-0- for ECSBC buildings and

1331

1332

1333 Table 4B-0- for ECSBC+ buildings and Super ECSBC buildings. Vertical fenestration on non-cardinal
 1334 direction, shall be categorized under a particular cardinal direction if its orientation is within ± 45° of that
 1335 cardinal direction.

1336 *Table 4B-0-11 Vertical Fenestration Assembly U-factor and SHGC Requirements for ECSBC Buildings*

| | <i>Composite</i> | <i>Hot and dry</i> | <i>Warm humid</i> | <i>and Temperate</i> | <i>Cold</i> |
|---|------------------|--------------------|-------------------|----------------------|-------------|
| Maximum U-factor (W/m ² .K) | 2.20 | 2.20 | 2.20 | 3.00 | 1.80 |
| Maximum SHGC Non-North | 0.25 | 0.25 | 0.25 | 0.25 | 0.62 |
| Maximum SHGC North for latitude ≥ 15°N | 0.50 | 0.50 | 0.50 | 0.50 | 0.62 |
| Maximum SHGC North for latitude < 15°N | 0.25 | 0.25 | 0.25 | 0.25 | 0.62 |

See Appendix A for default values of unrated fenestration.

1337
1338
1339

1340 *Table 4B-0-12 Vertical Fenestration U-factor and SHGC Requirements for ECSBC+ buildings*

| | <i>Composite</i> | <i>Hot and dry</i> | <i>Warm and humid</i> | <i>Temperate</i> | <i>Cold</i> |
|---|------------------|--------------------|-----------------------|------------------|-------------|
| Maximum U-factor (W/m ² .K) | 1.80 | 1.80 | 1.80 | 2.20 | 1.80 |
| Maximum SHGC Non-North | 0.25 | 0.25 | 0.25 | 0.25 | 0.62 |
| Maximum SHGC North for latitude ≥ 15°N | 0.50 | 0.50 | 0.50 | 0.50 | 0.62 |
| Maximum SHGC North for latitude < 15°N | 0.25 | 0.25 | 0.25 | 0.25 | 0.62 |

1341 *Table 4B-0-13 Vertical Fenestration U-factor and SHGC Requirements for Super ECSBC buildings*

| | <i>Composite</i> | <i>Hot and dry</i> | <i>Warm and humid</i> | <i>Temperate</i> | <i>Cold</i> |
|---|------------------|--------------------|-----------------------|------------------|-------------|
| Maximum U-factor (W/m ² .K) | 1.80 | 1.80 | 1.80 | 2.20 | 1.80 |
| Maximum SHGC Non-North | 0.20 | 0.20 | 0.20 | 0.20 | 0.62 |
| Maximum SHGC North for latitude ≥ 15°N | 0.50 | 0.50 | 0.50 | 0.50 | 0.62 |
| Maximum SHGC North for latitude < 15°N | 0.20 | 0.20 | 0.20 | 0.20 | 0.62 |

1342 **Exceptions to SHGC requirements in Table 4B-0- ,Table 4B-0-12 and Table 4B-013**

- 1343 (a) Fenestration with a permanent external projection, including but not limited to overhangs, side fins, box frame,
1344 verandah, balcony, and fixed canopies that provide permanent shading to the fenestration, the equivalent SHGC
1345 for the proposed shaded fenestration may be determined as less than or equal to the SHGC requirements of
1346 Table 4B-0- and Table 4B-0-12 Equivalent SHGC shall be calculated by following the steps listed below:
- 1347 i. Projection factor (PF) for the external permanent projection, shall be calculated as per the applicable shading
1348 type listed in chapter 8, section 8.2. The range of projection factor for using the SEF is $0.25 \leq PF \leq 1.0$. The
1349 SEF is applicable for both side fins shading only other than overhangs. The projection factor shall be
1350 calculated for both side fins and the lower projection factor of each fin shall be considered. Other shading
1351 devices shall be modelled through the Whole Building Performance Method in chapter 9.
1352
 - 1353 ii. A shaded vertical fenestration on a non-cardinal direction, shall be categorized either under a particular
1354 cardinal direction or a primary inter-cardinal direction if its orientation is within the range of $\pm 22.5^\circ$ of the
1355 cardinal or primary inter-cardinal direction.
1356
 - 1357 iii. Any surrounding man-made or natural sunlight obstructers shall be considered as a permanent shading of PF
1358 equal to 0.4 if;
 - 1359 a. the distance between the vertical fenestration of the building, for which compliance is shown, and
1360 surrounding man-made or natural sunlight obstructers is less than or equal to twice the height of the
1361 surrounding man-made or natural sunlight obstructers; and
1362
 - 1363 b. the surrounding man-made or natural sunlight obstructers shade the façade for at least 80% of the total
1364 time that the façade is exposed to direct sun light on a summer solstice. Compliance shall be shown
1365 using a sun path analysis for summer solstice for the vertical fenestration.

- 1366 iv. An equivalent SHGC is calculated by dividing the SHGC of the unshaded fenestration product with a Shading
1367 Equivalent Factor (SEF). SEF shall be determined for each orientation and shading device type from Table
1368 4B-0- and
1369 v.
1370 vi.
1371 vii. Table 4B-0-.
1372
1373 viii. The maximum allowable SHGC is calculated by multiplying the prescriptive SHGC requirement for respective
1374 compliance level from Table 4B-0- and
1375 ix.
1376 x.
1377 xi. Table 4B-0- with the SEF.

Vertical fenestration, located such that its bottom is more than 2.2 m above the level of the floor, is exempt from

1385

the SHGC requirements in Table 4B-0-, Table 4B-0-12 and

1386

1387

1388

Table 4B-0-, if the following conditions are complied with:

1389

i. The Total Effective Aperture (WWR X VLT) for the elevation is less than 0.25, including all fenestration areas more than 1.0 meter above the floor level; and,

1390

1391

1392

ii. An interior light shelf is provided at the bottom of this fenestration area, with a projection factor on interior side not less than:

1393

1394

1395

a. 1.0 for E-W, SE, SW, NE, and NW orientations

1396

1397

b. 0.50 for S orientation, and

1398

1399

c. 0.35 for N orientation when latitude is less than 15°N.

1400

A 5,400 m² two story office building in Delhi is trying to achieve ECSBC level compliance. It has a rectangular layout (90 m x 30 m) with floor to floor height of 4.0 m and floor area is evenly distributed over the two floors. Windows are either east or west facing and equally distributed on the two floors. The windows are all 1.85m in length and 2.165m in height with an overhang of 0.85 m, sill level is 1.385 m above floor level. The overall glazing area is 384 m². SHGC of the glazing in the East/West Fenestration is 0.30; area weighted U-Factor is 3.0 W/m².K. VLT of the glazing in all orientation is 0.5. Will the vertical fenestration comply with the ECSBC through prescriptive approach?

Solution:

Table 4B-0- lists the U-factor, SHGC and VLT requirements for vertical fenestration for ECSBC compliant buildings. The building is located in Delhi (Latitude: 28°70' N, Longitude: 77°10'E), which falls under the composite climate, as per Appendix B, Table 12.1. To fulfil prescriptive requirements, Window to Wall ratio ≤ 40%, SHGC ≤ 0.27, U-factor ≤ 3.0 W/m².K, and VLT ≥ 0.27.

Total Floor area = 5400 m²

Total wall area = 2 x (2x ((90m x 4m) + (30m x 4m))) = 1,920 m²

Total Fenestration area = 384 m²

Window to Wall Ratio (WWR) = 384/1,920 = 20%

As per the calculations, the building has a WWR of 20%, thus complying with the requirement for WWR. The U-factor is also equal to 3.0 W/m².K. Similarly, the VLT is 0.5, which is greater than the minimum specified value of 0.27, thus complying with the U-factor and VLT requirement.

Equivalent SHGC Calculation

The window SHGC is 0.3 which is not meet the prescriptive requirement of Table 4B-0-. However, the windows have an overhang of 0.85 m. As the windows have an overhang, this case will fall under the exception, and the *equivalent SHGC* value will be calculated by dividing fenestration SHGC by Shading Equivalent Factor (SEF).

For projection factor (PF) 0.34, the SEF for east, and west are taken from Table 4B-0-, as the latitude is greater than 15N.

SEF for east for PF = 0.3 (as worst case) = 1.26

Therefore, equivalent SHGC_{East} = 0.3 ÷ 1.26 = 0.24 Hence the vertical fenestration on the east façade will comply as per prescriptive approach, as the equivalent SHGC is less than maximum allowed.

Similarly, for the west façade:

SEF for west for PF = 0.3 (as worst case) = 1.27

Therefore, equivalent SHGC_{West} = 0.3 ÷ 1.27 = 0.24, hence the vertical fenestration on the west façade will comply using the prescriptive approach, as the equivalent SHGC is less than maximum allowed.

1403 Exceptions to U-factor requirements in Table 4B-0-, Table 4B-0-12 and

1404

1405

1406 Table 4B-0-:

1407 Vertical fenestration on all unconditioned buildings or unconditioned spaces may have a maximum U-factor
 1408 of 5 W/m².K provided they comply with all conditions mentioned in Table 4B-0-.

1409 *Table 4B-0-16 U-factor (W/m².K) Exemption Requirements for Shaded Building*

| Building Type | Climate zone | Orientation | Maximum Effective SHGC | Minimum VLT | PF |
|---|-----------------|---|------------------------|-------------|-------|
| Unconditioned buildings or unconditioned spaces | All except cold | Non-North for all latitudes and North for latitude < 15°N | 0.27 | 0.27 | ≥0.40 |
| | | North for latitude ≥ 15°N | 0.27 | 0.27 | ≥0.0 |

1410

1411 **4B.3.4 Skylights**

1412 Skylights shall comply with the maximum U-factor and maximum SHGC requirements of Table 4B-0-.
 1413 Skylight roof ratio (SRR), defined as the ratio of the total skylight area of the roof, measured to the outside
 1414 of the frame, to the gross exterior roof area, is limited to a maximum of 5% for ECSBC Building, ECSBC+
 1415 Building, and SuperECSBC Building, when using the Prescriptive Method for compliance.

1416 Table 4B-0-17 Skylight U-factor (W/m².K) and SHGC Requirements

| Climate | Maximum U-factor | Maximum SHGC |
|--------------------|------------------|--------------|
| All climatic zones | 4.25 | 0.35 |

1417 Exception to §4B.3.4 Skylights in temporary roof coverings or awnings over unconditioned spaces

1418 **4B.3.5 Building Envelope Trade-Off Method**

1419 The building envelope complies with the code if the Envelope Performance Factor (EPF) of the Proposed Building is less
 1420 than the EPF of the Standard Building, where the Standard Building exactly complies with the prescriptive requirements
 1421 of building envelope. This method shall not be used for buildings with WWR>40%. Trade-off is not permitted for
 1422 skylights. Skylights shall meet requirements of section 4B.3.4. The envelope performance factor shall be
 1423 calculated using the following equations.

1424 *Equation 0.1: EPF_{Total} = EPF_{Roof} + EPF_{Wall} + EPF_{Fenest}*

1425
$$EPF_{Roof} = c_{Roof} \sum_{s=1}^n U_s A_s$$

1426
$$EPF_{Wall} = c_{Wall} \sum_{s=1}^n U_s A_s$$

$$\begin{aligned}
1427 \quad EPP_{Fenest} &= c_{1F} \sum_{w=1}^n U_w A_w + c_{2Fenest,Nort} \sum_{w=1}^n \frac{SHGC_w}{SEF_w} A_w + c_{1Fenest,South} \sum_{w=1}^n U_w A_w \\
1428 \quad &+ c_{2Fenest,South} \sum_{w=1}^n \frac{SHGC_w}{SEF_w} A_w + c_{1Fenest,East} \sum_{w=1}^n U_w A_w \\
1429 \quad &+ c_{2Fenest,East} \sum_{w=1}^n \frac{SHGC_w}{SEF_w} A_w + c_{1Fenest,West} \sum_{w=1}^n U_w A_w \\
1430 \quad &+ c_{2Fenest,West} \sum_{w=1}^n \frac{SHGC_w}{SEF_w} A_w
\end{aligned}$$

1431 Whereas

- 1432 EPF_{Roof} Envelope performance factor for roofs. Other subscripts include walls and fenestration.
- 1433 A_s, A_w The area of a specific envelope component referenced by the subscript "s" or for windows the subscript "w".
- 1434
- 1435 $SHGC_w$ The solar heat gain coefficient for windows (w).
- 1436 SEF_w A multiplier for the window SHGC that depends on the projection factor of an overhang or side fin.
- 1437 U_s The U-factor for the envelope component referenced by the subscript "s".
- 1438 C_{Roof} A coefficient for the "Roof" class of construction.
- 1439 C_{wall} A coefficient for the "Wall"
- 1440 C_{1Fenes} A coefficient for the "Fenestration U-factor"
- 1441 C_{2Fenes} A coefficient for the "Fenestration SHGC"

1442 Values of "c" are taken from Table 4B- 0- through Table 4B-0-3 for each class of construction.

1449

1450 4B.3.5.1 [Standard Building EPF Calculation](#)

1451 EPF of the Standard Building shall be calculated as follows:

1452 (a) The Standard Building shall have the same building floor area, gross wall area and gross roof
 1453 area as the Proposed Building. For mixed-use building the space distribution between different
 1454 typologies shall be the same as the Proposed Design.

1455
 1456 The U-factor of each envelope component shall be equal to the criteria from §4B.3 for each
 1457 class of construction.

1458
 1459 The SHGC of each window shall be equal to the criteria from §4B.4.3.

1460
 1461 Shading devices shall not be considered for calculating EPF for Standard Building (i.e. SEF=1).

1462

Application of Building Envelope Trade-off method

A 1,000 m² single story daytime use office building in Ahmedabad is trying to achieve ECSBC level compliance. Each side has a band of windows, without shading. The materials for the envelope have already been selected, prior to opting for ECSBC compliance. Their thermal properties are: roof assembly U-value= .4 W/m².K, external wall assembly U-value = .25 W/m².K, glazing SHGC = .25, VLT = 0.27, area weighted U-value for glazing = 1.8 W/m².K. Dimensions of the building envelope are as follows:

According to Appendix B, Ahmedabad falls under the hot and dry climate zone. To prove compliance through the prescriptive approach, U-factor, and SHGC must comply with requirements listed in Table 4B- 0-5, Table 4B-0-8, Table 4B-0- and VLT and window to wall ratio with requirements in § 4.3.3 for a daytime use building in the hot and dry climate zone. The table below lists thermal properties of the building envelope components and the corresponding prescriptive requirements for ECSBC complaint buildings.

Table 4-3-1 Prescriptive Requirements and Proposed Thermal Properties

| | Prescriptive U-factor (W/m ² .K) | | | Proposed U-factor (W/m ² .K) | | | Area (m ²) |
|----------------------|--|-------|-------|--|------|------|---------------------------|
| Wall 1– North, South | ≤0.63 | | | 0.25 | | | 90 |
| Wall 2– East, West | ≤0.63 | | | 0.25 | | | 144 |
| Roof | ≤0.33 | | | 0.4 | | | 1000 |
| | U-factor | SHGC | VLT | U-factor | SHGC | VLT | |
| Window – South | ≤3.0 | ≤0.27 | ≥0.27 | 1.8 | 0.25 | 0.27 | 30 |
| Window – North | ≤3.0 | ≤0.5 | ≥0.27 | 1.8 | 0.25 | 0.27 | 30 |
| Window-East | ≤3.0 | ≤0.27 | ≥0.27 | 1.8 | 0.25 | 0.27 | 48 |
| Window-West | ≤3.0 | ≤0.27 | ≥0.27 | 1.8 | 0.25 | 0.27 | 48 |

§4B.3.3 requires the WWR to be less than 40%. This condition is fulfilled in the proposed buildings as can be seen in the calculations below.

Total Fenestration Area_{North, South} = 2 x (25m x 1.2m) = 60 m²

Wall Area_{North, South} = 2 x (25m x 3m) = 150 m²

Total Fenestration Area_{East, West} = 2 x (40m x 1.2m) = 96 m²

Total Wall Area_{East, West} = 2 x (40m x 3m) = 240 m²

Total Fenestration Area = 156 m², Total Wall Area = 390 m²

WWR = 156/390= 0.4.

U-value of the roof of the proposed building, at 0.4 W/m².K does not fulfil prescriptive requirements.

Hence, this building will not be compliant if the prescriptive approach is followed. The compliance in prescriptive approach can also be demonstrated through building envelope trade-off.

Compliance through Building Envelope Trade-off method

Envelope performance factor (EPF) for the Standard Building and Proposed Building must be compared. As per the Building Envelope Trade-off method, the envelope performance factor (EPF) shall be calculated using the following equations:

$$EPF_{Total} = EPF_{Roof} + EPF_{Wall} + EPF_{Fenest}$$

Where,

$$EPF_{Roof} = C_{Roof} \sum_{s=1}^n U_s A_s$$

$$EPF_{Wall} = C_{Wall} \sum_{s=1}^n U_s A_s$$

$$EPF_{Fenest} = C_{1Fenest,North} \sum_{w=1}^n U_w A_w + C_{2Fenest,North} \sum_{w=1}^n \frac{SHGC_w}{SEF_w} A_w + C_{1Fenest,South} \sum_{w=1}^n U_w A_w + C_{2Fenest,South} \sum_{w=1}^n \frac{SHGC_w}{SEF_w} A_w + C_{1Fenest,East} \sum_{w=1}^n U_w A_w + C_{2Fenest,East} \sum_{w=1}^n \frac{SHGC_w}{SEF_w} A_w + C_{1Fenest,West} \sum_{w=1}^n U_w A_w + C_{2Fenest,West} \sum_{w=1}^n \frac{SHGC_w}{SEF_w} A_w$$

Standard Building EPF will be derived from U-factors, SHGCs and VLTs of walls, roofs and fenestration from Table 4B-0-5, Table 4B-0-8, Table 4B-0-11 and § 4.3.3 for a daytime use building in the hot and dry climate zone. Values of C are from daytime Office building in hot and dry climatic zone for each class of construction from Table 4B-0-19. Since There is no shading for the windows, SEF_w will not be considered.

Step 1: Calculation of EPF Proposed Building from actual envelope properties

$$EPF_{Roof,Actual} = C_{Roof} \sum_{s=1}^n U_s A_s$$

$$= 43.9 \times 0.40 \times 1,000 = 17,560$$

$$EPF_{Wall,Actual} = C_{Wall} \sum_{s=1}^n U_s A_s$$

$$= (27.3 \times 0.25 \times 90) + (27.3 \times 0.25 \times 144) = 1,597.05$$

$$EPF_{Fenest} = EPF_{Fenest,North} + EPF_{Fenest,South} + EPF_{Fenest,East} + EPF_{Fenest,West}$$

$$EPF_{Fenest} = C_{1Fenest} \sum_{w=1}^n U_w A_w + C_{2Fenest} \sum_{w=1}^n \frac{SHGC_w}{SEF_w} A_w$$

Hence,

$$EPF_{Fenest,North} = 23.7 \times 1.8 \times 30 + 238.2 \times 0.25 \times 30 = 1,279.8 + 1,786.5 = 3,066.3$$

$$EPF_{Fenest,South} = 22.8 \times 1.8 \times 30 + 389.7 \times 0.25 \times 30 = 1,231.2 + 2,922.75 = 4,153.95$$

$$EPF_{Fenest,East} = 21.6 \times 1.8 \times 48 + 347.4 \times 0.25 \times 48 = 1,866.24 + 4,168.8 = 6,035.04$$

$$EPF_{Fenest,West} = 21.7 \times 1.8 \times 48 + 354.1 \times 0.25 \times 48 = 1,874.88 + 4,249.2 = 6,124.08$$

Therefore,

$$EPF_{Fenest} = 19,379.37$$

$$EPF_{Proposed} = 17,560 + 1,597.05 + 19,379.37 = 38,536.42$$

Step 2: Calculating EPF Standard Building from prescriptive envelope requirements

$$EPF_{Roof,Actual} = C_{Roof} \sum_{s=1}^n U_s A_s$$

$$= 43.9 \times 0.33 \times 1000 = 14,487$$

$$EPF_{Wall,Actual} = C_{Wall} \sum_{s=1}^n U_s A_s$$

$$= (27.3 \times 0.63 \times 90) + (27.3 \times 0.63 \times 144) = 1,547.91 + 2,476.66 = 4,024.57$$

$$EPF_{Fenest} = EPF_{Fenest,North} + EPF_{Fenest,South} + EPF_{Fenest,East} + EPF_{Fenest,West}$$

Now,

$$EPF_{Fenest,North} = 23.7 \times 3.0 \times 30 + 238.2 \times 0.5 \times 30 = 2,133 + 3,573 = 5,706$$

$$EPF_{Fenest,South} = 22.8 \times 3.0 \times 30 + 389.7 \times 0.27 \times 30 = 2,052 + 3,156.57 = 5,208.57$$

$$EPF_{Fenest,East} = 21.6 \times 3.0 \times 48 + 347.4 \times 0.27 \times 48 = 3,110.4 + 4,502.3 = 7,612.7$$

$$EPF_{Fenest,West} = 21.7 \times 3.0 \times 48 + 354.1 \times 0.27 \times 48 = 3,124.8 + 4,589.14 = 7,713.94$$

$$\text{Therefore, } EPF_{Fenest} = 26,241.21$$

$$EPF_{Baseline} = 14,487 + 4,024.57 + 26,241.21 = 44,752.78$$

Since $EPF_{Baseline} > EPF_{Proposed}$, therefore the building is compliant with ECSBC building envelope requirements.

1465 **4B 4. Alternative Compliance Path using Building Simulation**

1466 Compliance with the requirements of the envelope design may be demonstrated by using energy
 1467 simulation to meeting the Peak Envelope Heat Gain Rate as defined in Table 4B-0-23, Table 4B-0-
 1468 24, Table 4B-0-25 and Table 4B-0-26.

1469
 1470 **Peak Envelope Heat Gain Rate** = Total Envelope Heat Gain(W)/ Total Envelope Area (m²)
 1471

1472 Where:

1473 Total Envelope Heat Gain = Heat gain through the exterior walls+ Heat Gain through roof+ Heat
 1474 gain through the fenestration

1475 Total Envelope Area: Area of the exterior wall + area of the roof + area of the fenestration
 1476

4B.4.1 Methodology – Energy Simulation

- (a) The building envelope may be simulated with any BEE accepted whole building simulation software such as Energyplus, eQuest, VisDOE, Transys etc.
- (b) The Simulation should be done for a peak day with the following parameters:
 - i. The simulation model must have the same geometry and zoning as per the architectural design.
 - ii. The simulation should consider the peak cooling demand day in the year, and the schedule should consider 24 hours occupancy.
 - iii. The indoor temperature set point should be $22^{\circ} \pm 2^{\circ}$
 - iv. All other parameters should be as per Chapter 9 whole building simulation baseline parameters.
- (c) From the Simulation model, the heat gain through conduction for walls, roof and fenestration and solar- radiation heat gain through the glass in the fenestration may be obtained.
- (d) The Peak Envelope heat gain may be obtained by adding the heat gain through the roof, wall and fenestration (in KW) and dividing the same by the total façade area + roof area, so that the Peak envelope Heat Gain can be obtained in **KW/sqm**.

1512 **Normative Reference:**

1513 The following referenced documents are indispensable for the application of this document. For dated
1514 references, only the edition cited applies. For undated references, the latest edition of the referenced
1515 document (including any amendments) applies.

1516 The following Standards contain provisions which through reference in this text, constitute provisions of
1517 the standards. At the time of publication, the editions indicated were valid. All standards are subject to
1518 revision and parties to agreements based on this standard are encouraged to investigate the possibility of
1519 applying the most recent editions of the Standards indicated below:

| Standard Number | Title |
|-----------------------------|--|
| ISO-15099 (2003) | Thermal performance of windows, doors and shading devices -- Detailed calculations |
| ASTM E408-71 (2002) | Standard Test Methods for Total Normal Emittance of Surfaces Using Inspection-Meter Techniques. |
| ASTM E903-96 | Standard Test Method for Solar Absorbance, Reflectance, and Transmittance of Materials Using Integrating Spheres. |
| SP 7: 2016 | National Building Code of India 2016 (NBC 2016) |

DRAFT FOR STAKEHOLDER CONSULTATION

1539 5. Comfort Systems and Controls

1540 5.1 General

1541 All heating, ventilation, air conditioning (HVAC) equipment and systems contribute significantly to occupant comfort,
1542 productivity, health and well-being but simultaneously consume a major part of the energy consumed in the building.

1543 Therefore, conserving the energy consumed by HVAC equipment and systems assumes a lot of importance.

1544 Comfort systems and their controls shall comply with the mandatory provisions of Clause 5.2 and the prescriptive
1545 criteria detailed in Clause 5.3 for the respective building energy efficiency level. In case alternative compliance path
1546 of total system efficiency or low energy systems is used for compliance, respective requirements of Clause 5.3.11 or
1547 Clause 5.3.12 and relevant criteria of Clause 5.3 shall be complied.

1548 5.2 Mandatory Requirements

1549 5.2.1 Ventilation

1550 All habitable spaces shall be ventilated with outdoor air in accordance with the requirements of Clause 5.2.1 and
1551 guidelines specified in the National Building Code 2016 or its subsequent revisions (Part 8: Building Services, Section
1552 1: Lighting and Natural Ventilation, Subsection 5: Ventilation). Ventilated spaces shall be provided with outdoor air
1553 using one of the following:

- 1554 a) Natural ventilation
 - 1555 b) Mechanical ventilation
 - 1556 c) Mixed mode ventilation
- 1557

1558 Natural Ventilation Design Requirements

1559 Naturally ventilated buildings shall meet the following requirements.

- 1560 a) If the building has ceiling fans, they shall comply with the requirements of BEE 3-star rating at the minimum.
- 1561 b) Air circulators, if provided, shall comply with IS 2997.
- 1562 c) Exhaust fans, if provided, shall comply IS 2312 with minimum efficiency requirements of fans specified in Clause
1563 5.3.1.

1564 Mechanical Ventilation Air Quantity Design Requirements

1565 Buildings that are ventilated using a mechanical ventilation system, either completely or in conjunction with natural
1566 ventilation systems, shall have a ventilation system controlled by Carbon Monoxide sensors for basement carpark
1567 spaces where the total car park space is greater than or equal to 600 m².

1568 Demand Control Ventilation

1569 Mechanical ventilation systems serving Air conditioning spaces shall have demand control ventilation if they provide
1570 outdoor air greater than 5400 m³/hr to the conditioned space. Such outdoor air supply to the space shall be through:

- 1571 An air side economizer, or
- 1572 Automatic modulating control of the outdoor air damper actuated through CO₂ sensors mounted within the
1573 space. CO₂ sensors shall be mounted at breathing height level and shall be provided for any space in excess
1574 of 50 m².

1575 Demand control ventilation if employed, shall ensure that outdoor air supply to the space meets the minimum
1576 ventilation requirement as specified in NBC 2016 or its subsequent revisions.

1577

1578 Exceptions to 5.2.1.3

- 1579 a) Any space that has processes or operations that generate dust, fumes, mists, vapors or gases and are provided
1580 with mechanical exhaust.

1581 b) Systems with exhaust air energy recovery.

1582 5.2.2 Space Conditioning Equipment

1583 Chillers

1584 a) For ECSBC Compliance minimum 2 Star rated chillers shall be installed.

1585

1586 b) At locations where cooling water and / or recycled water is available, water-cooled chillers should be
 1587 installed. Air-cooled systems or Hybrid configurations (Mix of Water Cooled and Air Cooled) should be used
 1588 in buildings where the total cooling load to be catered to by the air cooled system is less than 530 kW. For
 1589 buildings with cooling load equal to or greater than 530 kW, the capacity of air cooled chiller shall be
 1590 restricted to 33% of the total installed chilled water plant capacity (excluding standby, if any) . Local
 1591 approving authority / Authority Having Jurisdiction (AHJ) may require a higher percentage of air cooled
 1592 chillers in a project depending on local conditions in which case, same shall be complied with.

1593 Unitary, Split, Packaged Air-Conditioners

1594 Unitary (window), Split and Packaged air-conditioners shall meet or exceed the efficiency requirements given in **Error!**
 1595 **Reference source not found.**1. Window and split air conditioners shall be BEE Star labelled. EER shall be as per IS 8148
 1596 for all Unitary, Split and Packaged air conditioners of capacity greater than 10.5 kW.

1597 Table 5.1 Minimum Requirements for Unitary, Split, Packaged Air Conditioners in ECSBC Building

| Cooling Capacity (kW _r) Cooled | Water | Air Cooled |
|---|-------|------------|
| ≤ 10.5 | NA | BEE 3 Star |
| > 10.5 | 3.7 | 3.2 EER |

1598 Variable Refrigerant Flow (VRF air-conditioners)

1599 Variable Refrigerant Flow (VRF) systems shall be of the minimum efficiency requirements as specified in Table 5-2
 1600 tested at the capacity rating condition as defined. Rating conditions both at full load as well as part load conditions
 1601 shall be as per BIS Standard for VRF Air Conditioners which is under development.

1602 Table 5-2: Minimum Efficiency Requirements for VRF Air conditioners for ECSBC Building (The ISEER and EER ratings
 1603 calculation shall be as per BIS Standard **as and when published**)

| Type | Size category (kW _r) | For Heating or cooling or both | |
|-------------------------------------|----------------------------------|--------------------------------|--|
| | | ISEER (W/W) | |
| VRF Air Conditioners, Air cooled | < 40 | 5.4 | |
| | >= 40 and < 70 | 5.5 | |
| | >= 70 | 5.6 | |

1604 Air Conditioning and Condensing Units serving Computer Rooms and other special applications.

1605 a) Air conditioning and condensing units serving computer rooms shall be of minimum energy efficiency as per
 1606 the Table 5-3.

1607 Table 5-3: Minimum Efficiency Requirements for Computer Room Air Conditioners

| Equipment type | Net Sensible Capacity ^a | Cooling | Minimum SCOP-127 ^b | |
|--|---------------------------------------|---------|-------------------------------|--------|
| | | | Downflow | Upflow |
| All types of computer room ACs Air/ Water/ Glycol | All capacity | | 2.5 | 2.5 |

a. Net Sensible cooling capacity = Total gross cooling capacity - latent cooling capacity – Fan power

b. Sensible Coefficient of Performance (SCOP-127): A ratio calculated by dividing the net sensible cooling capacity in watts by the total power input in watts (excluding reheater and dehumidifier) at conditions defined in ASHRAE Standard 127-2012 Method of Testing for Rating Computer and Data Processing Room Unitary Air Conditioners)

1608 b) In respect of 24-hour operational areas such as server/battery rooms in otherwise 8 or 12 hour occupancies
1609 separate air conditioning units shall be installed for such areas which can act as a stand by unit when the
1610 central system is operational but can take over when the central system is shut down. Similarly, where
1611 temperatures lower than those to be maintained in other areas of the building are required in certain areas
1612 (example : Operation theatres in hospitals) separate condensing units shall be installed for such areas so that
1613 the central system can work with higher efficiency.

1614 **Hot water production (For heating or reheat in HVAC Systems)**

1615 Hot water shall be produced through any one of the following methods:

1616 Solar water heating. Solar water heating system shall comply with IS 12976 and shall be minimum BEE 3-star
1617 rated.

1618 Heat recovery systems using waste heat from air/ water cooled condensers.

1619 Air to water or water to water heat pumps

1620 Note:

1621 Use of Electric, Gas or Oil-fired boilers shall be discouraged in ECSBC buildings unless they are required for any process
1622 requirements and by-product steam, or hot water is available for heating or reheat purposes.

1623 For service water heating in the building, please refer to Section 8

1624 **5.2.3 Controls**

1625 To comply with the Code, buildings shall meet the requirements of Clause 5.2.3.1 through Clause 5.2.3.6.

1626 **Timeclock**

1627 Mechanical cooling and heating systems in all occupancies other than healthcare, shall be controlled by timeclocks
1628 that:

1629 (a) Can start and stop the system under different schedules for at least three different day-types per week,

1630 (b) Include an accessible manual override that allows temporary operation of the system for up to 2 hours.

1631 Exceptions to Clause 5.2.3.1 :

1632 Cooling and Heating systems of capacity less than 17.5 kW_r.

1633 **Temperature Controls**

1634 Mechanical cooling and heating equipment in all buildings shall be installed with automatic controls to manage the
1635 temperature inside the conditioned zones. Each zone served by HVAC conditioning equipment shall have individual
1636 temperature control for energy saving. These controls shall comply with the following requirements:

1637 a) Where a unit provides both heating and cooling, controls shall be capable of providing a temperature dead band
1638 of 3.0°C within which the supply of heating and cooling energy to the zone is shut off or reduced to a minimum.

1639 b) Where separate heating and cooling equipment serve the same temperature zone, temperature controls shall
1640 be interlocked to prevent simultaneous heating and cooling.

1641 c) Separate temperature control shall be installed in each

1642 Guest room of hotels and resorts,

1643 li Individual zones in office buildings

1644 lii Air-conditioned classroom, lecture room, and computer room of educational institutions.

1645 liv In-patient rooms and wards in healthcare facilities

1646 **Occupancy Controls**

1647 Occupancy controls shall be installed at each zone level to de-energize or to throttle to reduce or minimize the fresh
 1648 air ventilation and/or air conditioning systems when the building or part of the building or individual zones served by
 1649 that system are not occupied.

1650 Example: hotel guest rooms, office cabins, conference rooms in different building typologies, classrooms, hospital
 1651 rooms etc.

1652 For operational reasons, if the HVAC equipment can't be turned-off, the room temperature set-point shall be
 1653 automatically increased to a higher default value of 27°C or higher for energy saving.

1654 **Cooling Tower Fan Controls.**

1655 Cooling towers in buildings with built up area greater than 20,000 m² and located in a place where the wet bulb
 1656 temperature drops below 17°C shall have fan controls based on wet bulb logic capable to reduce fan speed up to 50
 1657 Percent of the rated full speed.

1658 **AHU Fan**

1659 Air Handling Units serving different zones of a building shall deploy fan speed modulation control to save energy, using
 1660 duct static pressure signal.

1661
 1662 Exception to clause 5.2.3.5: Air handling units with capacity less than 5000 cmh .

1663 **Damper controls**

1664 Where multiple fans serve the same supply or exhaust system, automatic shutdown dampers shall be provided with
 1665 input from pressure transducers.

1666 Exception to Clause 5.2.3.6: Dampers shall not be provided in exhaust systems serving kitchen exhaust hoods.

1667 **5.2.4 Piping and Ductwork**

1668 Piping for heating, space conditioning, and service hot water systems shall meet the insulation requirements listed
 1669 in Table 5-4 through Table 5-6. Insulation exposed to weather shall be protected by aluminium sheet, painted
 1670 canvas, or plastic cover. Cellular foam insulation shall be protected as above or be painted with water resistant
 1671 paint.

1672 Where pipes are located within air-conditioned spaces or are buried in ground, the R Value indicated in Table 5.4
 1673 through 5.6 may be reduced by 0.2. Where pipes are located outside the building and in direct exposure to weather,
 1674 the R Values given in Tables 5.4 through 5.6 shall be increased by 0.2.

1675 Table 5-4 Insulation Requirements for Pipes in ECSBC Building

| Operating Temperature (°C) | Pipe size (mm) | |
|---|--|-----|
| | <40 | ≥40 |
| | Insulation R value (m ² .K/W) | |
| Heating System | | |
| >94°C and ≤121°C | 0.9 | 1.2 |
| >60°C and ≤94°C | 0.7 | 0.7 |
| >40°C and ≤60°C | 0.4 | 0.7 |
| Cooling System | | |
| >4.5°C and ≤15°C | 0.7 | 0.9 |
| < 4.5°C | 0.9 | 1.2 |
| Refrigerant Piping (Split systems) | | |
| >4.5°C and ≤15°C | 0.4 | 0.7 |
| < 4.5°C | 0.9 | 1.2 |

1676 Table 5-5 Insulation Requirements for Pipes in ECSBC+ Building

| Operating Temperature (°C) | Pipe size (mm) | |
|------------------------------------|--|-----|
| | < 40 | ≥40 |
| | Insulation R value (m ² .K/W) | |
| Heating System | | |
| >94°C and ≤121°C | 1.1 | 1.3 |
| >60°C and ≤94°C | 0.8 | 0.8 |
| >40°C and ≤60°C | 0.5 | 0.9 |
| Cooling System | | |
| >4.5°C and ≤15°C | 0.9 | 1.0 |
| < 4.5°C | 1.1 | 1.3 |
| Refrigerant Piping (Split systems) | | |
| >4.5°C and ≤15°C | 0.5 | 0.9 |
| < 4.5°C | 1.1 | 1.3 |

1677 Table 5-6 Insulation Requirements for Pipes in Super ECSBC Buildings

| Operating Temperature (°C) | Pipe size (mm) | |
|------------------------------------|--|-----|
| | < 40 | ≥40 |
| | Insulation R value (m ² .K/W) | |
| Heating System | | |
| >94°C and ≤121°C | 1.5 | 1.5 |
| >60°C and ≤94°C | 1.0 | 1.3 |
| >40°C and ≤60°C | 0.7 | 1.1 |
| Cooling System | | |
| >4.5°C and ≤15°C | 1.0 | 1.2 |
| < 4.5°C | 1.5 | 1.5 |
| Refrigerant Piping (Split systems) | | |
| >4.5°C and ≤15°C | 0.7 | 0.9 |
| < 4.5°C | 1.5 | 1.5 |

1678

1679 5.2.4.2 Ductwork and Plenum Insulation

1680 Ductwork and plenum shall be insulated in accordance with Table 5-7.

1681 Table 0-7 Ductwork Insulation (R value in m². K/W) Requirements

| Duct Location | Supply ducts | Return ducts |
|---------------------|--------------|--------------|
| Exterior | R -1.4 | R -0.6 |
| Unconditioned Space | R -0.6 | None |
| Buried | R -0.6 | None |

1682 **5.2.5 Commissioning of Systems**

1683 In respect of all occupancies specified in the code with built up area exceeding 5000 m² (excluding any non- air
 1684 conditioned basements), the HVAC System shall be Commissioned as specified in Section 12 of this Code .

1685 In addition to the above, system balancing shall be done for all air and water systems serving zones with a total
 1686 conditioned area exceeding 500 m².

1687 **Air System Balancing**

1688 Air systems shall be balanced in a manner to first minimize throttling losses; then, for fans with fan system power
1689 greater than 0.75 kW, fan speed shall be adjusted to meet design flow conditions.

1690 **Hydronic System Balancing**

1691 Hydronic systems shall be proportionately balanced in a manner to first minimize throttling losses; then the pump
1692 impeller shall be trimmed, or pump speed shall be adjusted to meet design flow conditions.

1693 **5.2.6 Condenser Locations**

1694 Air cooled condensers shall be located such that the heat sink is free from of interference of heat discharge by devices
1695 located in adjoining spaces, and do not interfere with other such systems installed nearby.

1696 **5.3 Prescriptive Requirements**

1697 Compliance shall be demonstrated with the prescriptive requirements in this section.

1698 **5.3.1 Fans**

1699 Supply, exhaust, and return or relief fans with motor power exceeding 0.37 kW shall be of minimum Mechanical
1700 Efficiency and minimum fan motor efficiency requirements specified in Table 5-8 through Table 5-

1701 Exception to Clause 5.3.1: Fans in un-ducted air conditioning unit where fan efficiency has already been taken into
1702 account to calculate the total efficiency of the comfort system.

1703 In respect of all Centrifugal and Axial Flow fans used in the Comfort system, Fan Energy Index (FEI) shall meet or
1704 exceed the requirements as below:

1705
$$\text{Fan Energy Index (FEI)} = \frac{\text{(Baseline Fan Electric Input Power)}}{\text{(Actual Fan Input Electric Power)}}$$

1706 (i) For Centrifugal fans requiring shaft power 2.5KW or higher, the FEI shall be ≥ 1.1

1707 (ii) For Axial flow fans requiring shaft power 2.5KW or higher, FEI shall be ≥ 1 .

1708
1709
1710

Table 5-8 Mechanical and Motor Efficiency Requirements for Fans in ECSBC Buildings

| System type | Fan Type | Mechanical Efficiency | Motor Efficiency (As per IS 12615) |
|-------------------|----------------------------|-----------------------|---------------------------------------|
| Air-handling unit | Supply, return and exhaust | 65% | IE 3 |

1711 Table 5-9 Mechanical and Motor Efficiency Requirements for Fans in ECSBC+ Buildings

| System type | Fan Type | Mechanical Efficiency | Motor Efficiency (As per IS 12615) |
|-------------------|----------------------------|-----------------------|---------------------------------------|
| Air-handling unit | Supply, return and exhaust | 70% | IE 4 |

1712 Table 5-10 Mechanical and Motor Efficiency Requirements for Fans in Super ECSBC Buildings

| System Type | Fan Type | Mechanical Efficiency | Motor Efficiency (As per IS 12615) |
|-------------------|----------------------------|-----------------------|---------------------------------------|
| Air-handling unit | Supply, return and exhaust | 75 % | IE 4 |

1713 **5.3.2 Chillers**

1714 Chillers shall be of minimum efficiency requirements as per Standards and Labelling Program of BEE for ECSBC, ECSBC+
 1715 and Super ECSBC buildings. BEE Star rating for ECSBC, ECSBC+ and Super ECSBC Buildings shall be as indicated in Table
 1716 5-1. Chillers shall be rated both at full load and at part load conditions in accordance with IS 16590

1717 Table 5-14 Minimum Efficiency Requirements for Chillers for ECSBC, ECSBC+ and Super ECSBC Buildings

| Building Category | Water Cooled | Air Cooled |
|-------------------|--------------|------------|
| ECSBC | 2 Star | 2 Star |
| ECSBC+ | 4 Star | 4 Star |
| SUPER ECSBC | 5 Star | 5 Star |

1718 **5.3.3 Pumps**

1719 Chilled Water and condenser water pumps shall meet or exceed the minimum energy efficiency requirements
 1720 specified in Table 5-12 through

1721

1722

1723 Table 5-16. Requirements for pumps in district cooling systems and hot water pumps for space heating are limited
 1724 to the installed efficiency requirement of individual pump equipment only. To show compliance, calculate the total
 1725 installed pump capacity in kilo watt and achieve the prescribed limits per kilo watt of refrigeration installed in the
 1726 building .

1727 Pumps used in HVAC Systems shall meet or exceed the minimum efficiency requirements as per Table 5.12 through
 1728 5.14.

1729 Table 5-12 Pump Efficiency Requirements for ECSBC Building

| Equipment | ECSBC |
|--|--|
| Chilled Water Pump (Primary and Secondary) | 18.2 W/ kW _r with VFD on secondary pump |
| Condenser Water Pump | 17.7 W/ kW _r |
| Pump Efficiency (minimum) | 70% |
| Motor Efficiency (as per IS 12615) | IE3 or better |

1730 Table 5-15 Pump Efficiency Requirements for ECSBC+ Building

| Equipment | ECSBC+ Building |
|--|--|
| Chilled Water Pump (Primary and Secondary) | 16.9 W/ Kw _r with VFD on secondary pump |
| Condenser Water Pump | 16.5 W/ Kw _r |
| Pump Efficiency (minimum) | 75% |
| Motor Efficiency (as per IS 12615) | IE4 or better |

1731

1732

1733

1734 Table 5-16 Pump Efficiency Requirements for SuperECSBC Building

| SuperECSBC Building | |
|------------------------------------|---|
| Chilled Water Pump | 14.9 W/ kW _r with variable primary pumping |
| Condenser Water Pump | 14.6 W/ kW _r |
| Pump Efficiency (minimum) | 80% |
| Motor Efficiency (as per IS 12615) | IE4 or better |

5.3.4 Cooling Towers

Cooling towers shall be designed for an Approach not exceeding 3.9°C in respect of ECSBC Buildings and 2.8°C in respect of ECSBC+ and Super ECSBC Buildings. They shall meet fan efficiency requirements as specified in Table 5.15 through Table 5-17.

1736 Table 5-17 Cooling Tower Fan Efficiency Requirements for ECSBC Buildings

| Equipment type | Rating Condition | Efficiency |
|---------------------------------|---|---------------|
| Open circuit cooling tower Fans | 37.2°C entering water 31.6°C leaving water 28.3 °C WB outdoor air | 0.35 kW/(L/s) |

1737 Table 5-16 Cooling Tower fan Efficiency Requirements for ECSBC+ Buildings

| Equipment type | Rating Condition | Efficiency |
|--|--|---------------|
| Open circuit cooling tower Fans for Chillers ≤530kW _r | 36.4°C entering water 30.8°C leaving water 28.3°C WB outdoor air | 0.35 kW/(L/s) |

1738 Table 5-17 Cooling Tower fan Efficiency Requirements for Super ECSBC Buildings

| Equipment type | Rating Condition | Efficiency |
|--|--|----------------|
| Open circuit cooling tower Fans for Chillers ≤530kW _r | 35.6°C entering water 30.0°C leaving water 28.3°C WB outdoor air | 0.35 kW/(L/s) |

1739 5.3.5 Economizers

1740 Economizer for ECSBC, ECSBC+, and Super ECSBC Building

1741 Each cooling fan system in buildings with built up area greater than 20,000 m², shall include at least one of the
1742 following:

- 1743 (a) An air economizer capable of modulating outside-air and return-air dampers to supply 50% of the design supply
1744 air quantity as outside-air.
1745 (b) A water economizer capable of providing 50% of the expected system cooling load at outside air temperatures
1746 of 10°C dry-bulb/7.2°C wet-bulb and below.
1747 Exception to Clause 5.3.5.1:

- 1748 (a) Projects in warm-humid climate zones.
1749 (b) Projects with only daytime occupancy in the hot-dry climatic zone.
1750 (c) Individual cooling or heating fan systems less than 11520 CMH

1751 **Partial Cooling .**

1752 Where required by Clause 5.3.5.1, economizers shall be capable of providing partial cooling even when additional
1753 mechanical cooling is required to meet the cooling load.

1754 5.3.5.3 Economizer Controls.

1755 Air side economizer shall be equipped with controls.

- 1756 (a) That allow dampers to be sequenced with the mechanical cooling equipment and not be controlled by only mixed
1757 air temperature.
1758 (b) Capable of automatically reducing outdoor air intake to the design minimum outdoor air quantity when outdoor
1759 air intake will no longer reduce cooling energy usage.
1760 (c) Capable of high-limit shutoff at 24 °C dry bulb temperature.
1761

1762 **Testing of Economizers.**

1763 Air side economizers shall be tested in the field following the requirements in Appendix 12 of ECBC to ensure proper
1764 operation.

1765 Exception to clause 5.3.5.3 Air side economizers which is factory tested and calibrated as per procedures given in 12
1766 of ECBC 2017 to ensure proper operation and duly certified by Authority Having Jurisdiction (AHJ)

1767 **5.3.6 Variable Flow Hydronic Systems**

1768 **Variable Fluid Flow**

1769 HVAC pumping systems having a total pump system power exceeding 7.5 kW shall be designed for variable fluid flow
1770 and shall be capable of reducing pump flow rates to an extent which is lesser or equal to the limit, where the limit is
1771 set by the larger of:

- 1772 (a) 50% of the design flow rate, or
1773 (b) The minimum flow required by the equipment manufacturer for proper operation of the chillers .

1774 **Automatic shut off of Condenser water flow.**

1775 Water cooled air-conditioning or heat pump units with a circulation pump motor greater than or equal to 7.5 kW shall
1776 have two way automatic isolation valve or other control provisions on each water cooled air conditioning or heat
1777 pump circuit which are interlocked to the compressor to shut off water flow through the circuit as well as dedicated
1778 cooling tower fan when the respective compressor is not operating.

1779 **5.3.7 Unitary, Split, Packaged Air-Conditioners**

1780 Unitary (Window) and Split air-conditioners which are non- ducted and have a capacity of up to 10499
1781 Wr and light commercial air conditioners from 10500 to 18000 Wr (All air cooled systems) shall comply
1782 with IS1391 Part 1 and Part 2 are shall meet or exceed the minimum efficiency requirements as under :

1783 ECSBC + BEE 4 Star

1784 Super ECSBC BEE 5 Star

1785 Ducted and Packaged air conditioners of capacity above 3500 Wr shall comply with IS 8148 for both air
 1786 cooled and water cooled systems and the minimum efficiency requirements shall be as per Table 5.18 for
 1787 ECSBC + and Table 5.19 for Super ECSBC Buildings.

1788 Table 5-18 Minimum Efficiency Requirements for Ducted Split and Packaged Air Conditioners in ECSBC+ Building

| Cooling Capacity (kWr) Cooled | Water | Air Cooled |
|----------------------------------|-------|------------|
| ≤ 10.5 | NA | BEE 4 Star |
| > 10.5 EER | 3.7 | 3.2 EER |

1789

Table 5-19 Minimum Requirements for Ducted Split and Packaged Air Conditioners in Super ECSBC Building

| Cooling Capacity (kWr) Cooled | Water | Air Cooled |
|----------------------------------|-------|------------|
| ≤ 10.5 | NA | BEE 5 Star |
| >10.5 EER | 3.9 | 3.4 EER |

1790 *Note: The EER values in Table 5.18 and 5.19 will be replaced by IEER values in respect of units of capacity*
 1791 *more than 10500Wr when the BEE Star Labelling Program is made effective for this range. Minimum*
 1792 *efficiency levels for Air Cooled as well as Water Cooled systems shall comply with BEE 4 Star for ECSBC +*
 1793 *Buildings and 5 Star for Super ECSBC Buildings.*

1794 **5.3.8 Variable Refrigerant Flow Air conditioners**

1795 Variable Refrigerant Flow (VRF) Air conditioners shall meet or exceed the efficiency requirements given in Table 5-
 1796 20 through Table 5-22.VRF Air Conditioners shall be rated for full load as well as part load operating conditions in
 1797 accordance with the BIS Standard for VRF air conditioners which is currently in draft form.

1798 Table – 5-20 Minimum Efficiency Requirements for VRF Air conditioners for ECSBC Buildings

| | ECSBC |
|------------------------|-------|
| | ISEER |
| For <40kWr | 5.4 |
| For ≥ 40kWr and <70kWr | 5.5 |
| For ≥70kWr | 5.6 |

1799 Table – 5-21 Minimum Efficiency Requirements for VRF Air conditioners for ECSBC+ Buildings

| | ECSBC+ |
|------------------------|--------|
| | ISEER |
| For <40kWr | 6.4 |
| For ≥ 40kWr and <70kWr | 6.5 |
| For ≥70kWr | 6.6 |

1800 Table – 5-22 Minimum Efficiency Requirements for VRF Air conditioners for Super ECSBC Buildings

| | Super ECSBC |
|------------------------|-------------|
| | ISEER |
| For <40kWr | 7.4 |
| For ≥ 40kWr and <70kWr | 7.5 |
| For ≥70kWr | 7.6 |
| | |

1801 **5.3.9 Controls for ECSBC+ Buildings**

1802 ECSBC+ rated building shall have automated control capability to achieve below requirements in addition to
 1803 complying with requirements of Clause 5.2.3.

1804 a) Zone Temperature control:

1805 The space temperature set point in common area (which is not accessible to individuals) shall be varied automatically,
 1806 based on outside temperature and moved up to higher level within the defined comfort zone.

1807 b) AHU fan energy optimization:

1808 The Control system shall have the capability to optimize (reduce) the AHU fan static pressure, wherever the AHU
 1809 serves multiple zones through “Zone temperature control devices “ such as VAV boxes, auto -regulating diffusers etc.
 1810 The control system shall have the capability to monitor such devices and optimize the dynamic set point of the fan
 1811 static pressure sensor in the duct, thus controlling the fan speed while maintaining thermal comfort to the occupied
 1812 zones.

1813 c) Secondary pump energy optimisation: -

1814 The Control system shall have the capability to optimize the pump speed requirement to feed different loops and
 1815 equipment and optimise chilled water flow across AHUs and terminal units.

1816 **5.3.10 Controls for Super ECSBC Buildings**

1817 Super ECSBC Buildings shall comply with requirements of this clause in addition to complying with requirements of
 1818 Clause 5.2.3 and Clause 5.3.9.

1819 a) Zone Temperature Control

1820 Heating and cooling set points of the Zone temperature controllers shall be checked at regular intervals. The users
 1821 often modify these set points. A centralized system shall detect and correct extreme values of set points due to
 1822 misunderstanding of users.

1823 b) Control of Fenestration Louver or Blinds

1824 Buildings with large glass facades shall have capability to automatically adjust, open or close the curtains, blinds or
 1825 external louvers for combined benefits of reducing solar heat gain, harvesting natural sunlight and to avoid glare.

1826 c) Occupancy control:

1827 Conditioning equipment serving large zones (like Workstation area) shall have capability to save energy based on real-
 1828 time headcount.

1829 d) Chiller Plant Control

1830 Chilled water systems greater than 1500KW capacity (cumulative) or having more than three chillers in one plant
 1831 room shall have controls capability to optimize the performance of chillers, pumps and cooling tower fans and
 1832 match chilled water demand and supply requirement on real-time basis.

1833 Note: For recommended controls to meet the prescriptive requirements of the code to comply with ECSBC, ECSBC+
 1834 and Super ECSBC levels of certification, please refer to Table 13.1 in section 13 IoT and Controls and the Informative
 1835 Annexure - A.

1836 **5.3.11 Energy Recovery**

1837 All hospitality and healthcare occupancies with energy recovery systems of capacity greater than 7560 CMH and
 1838 minimum outdoor air supply of 70% shall have air-to-air heat recovery equipment with minimum 60 % recovery
 1839 effectiveness.

1840 Exception to Clause 5.3.11: Energy recovery from Kitchen, Laundry and Laboratory exhaust systems.

1841 **5.3.12 Total System Efficiency – Alternate Compliance Approach**

1842 Buildings may show compliance by optimizing the total system efficiency for the plant side comfort system instead of
 1843 the individual equipment mentioned under the prescriptive requirement. This alternate compliance approach is
 1844 applicable for central chilled water plant side system in all building types. The total installed capacity per kilo-watt
 1845 refrigeration load shall be less than or equal to maximum threshold requirements as specified in Table 5-23.
 1846 Equipment that shall be included in central chilled water plant side system for this alternate approach are chillers,
 1847 chilled water pumps, condenser water pumps, and cooling tower fan. Compliance check will be based on annual
 1848 hourly simulation refer Table _____ for developing the proposed design.

1849 Table 5-23 Maximum System Efficiency Threshold for ECSBC, ECSBC+, and Super ECSBC Buildings

| Water Cooled Chilled Water Plant | Maximum Threshold (kWh/kW .Hr) |
|----------------------------------|--------------------------------|
| ECSBC | 0.24 |
| ECSBC+ | 0.21 |
| Super ECSBC | 0.19 |

1850 **5.3.12.1 Documentation Requirement**

1851 Compliance shall be documented, and compliance forms shall be submitted to the certifying authority at local level.
 1852 The information submitted shall include, at a minimum, the following:

- 1853 (c) Summary describing the results of the analysis, including the annual energy use (kWh) of chilled water plant
 1854 (chillers, pumps and cooling tower) and annual chilled water use (kWh)for the proposed design, and software
 1855 used.
- 1856 (d) Brief description of the project with location, number of stories, space types, conditioned and unconditioned
 1857 areas, hours of operation.
- 1858 (e) List of the energy-related building features of the proposed design.
- 1859 (f) List showing compliance with the mandatory requirements of this code.
- 1860 (g) The input and output report(s) from the simulation program including energy and chilled water usage
 1861 components: space cooling and heat rejection equipment, and other HVAC equipment (such as pumps). The
 1862 output reports shall also show the number of hours any loads that are not met by the HVAC system in the
 1863 proposed design.
- 1864 (h) Explanation of any significant modelling assumptions made.
- 1865 (g) Explanation of any error messages noted in the simulation program output.

1866 The total system efficiency shall be calculated as follows:

1867
$$\text{Total System Efficiency} = \frac{\text{Annual Chiller plant Energy consumption(kWh)}}{\text{Annual Chilled water generation (kWrh)}}$$

1868 **5.3.13 Low-energy Comfort Systems**

1869 Alternative HVAC systems which have low energy use may be installed in place of (or in conjunction with) refrigerant-
1870 based cooling systems. Such systems shall be deemed to meet the minimum space conditioning equipment efficiency
1871 levels of Clause 5.2.2, but shall comply with all other applicable mandatory provisions of Clause 5.2 as applicable.
1872 Wherever applicable, requirements of Clause 5.3 and Clause 5.3.12 shall be complied with. The approved list of low
1873 energy comfort systems¹ is given below:

- 1874 (i) Evaporative cooling
- 1875 (j) Desiccant cooling system
- 1876 (k) Solar air conditioning
- 1877 (l) Tri-generation (waste-to-heat)
- 1878 (m) Radiant cooling system
- 1879 (n) Ground source heat pump
- 1880 (o) Adiabatic cooling system
- 1881 (p) Under-floor Air distribution (UFAD) system

1882
1883 Buildings with an approved low energy comfort system installed for more than 50 % of the sum of cooling and heating
1884 capacity requirement of the building shall be deemed to be equivalent to ECSBC + and those with more than 90 %
1885 shall be deemed to be Super ECSBC Compliant subjected to meeting the documentation requirement as per 5.3.13.1..

1886 **5.3.13.1 Documentation Requirement**

1887
1888 Compliance shall be documented and submitted to the certifying authority at local level having jurisdiction.
1889 Documentation shall include, at a minimum, the following.

- 1891 a) Brief details of the low- energy comfort system. type, capacity and efficiency.
- 1892 b) Details of compliance with mandatory and prescriptive requirements other than those exempted in Clause
1893 5.3.13.
- 1894 c) Comparison of installed capacity of the approved low-energy comfort system as against the conventional
1895 system with calculations for energy consumption of both the systems.

ECSBC – LIGHTING AND CONTROLS

1902

1903

1904

1905

1906

DRAFT FOR STAKEHOLDER CONSULTATION

1907 **6. Lighting and Controls**

1908 **6.1 General**

1909 Lighting systems and equipment shall comply with the mandatory provisions of 6.2 and the prescriptive
1910 criteria of 6.3. The lighting requirements in this section shall apply to:

- 1911 (a) Interior spaces of buildings,
1912 (b) Exterior building features namely facades, illuminated roofs, architectural features, entrances, exits,
1913 loading docks, and illuminated canopies, and, the building grounds lighting that is provided through
1914 the building's electrical service.

1915 Exceptions to 6.1:

- 1916 a) Emergency or security lighting that is automatically off during normal building operations.
1917 b) Lighting, including exit signs, that is specifically designated as required by a health or life safety
1918 statute, ordinance, or regulation.

1919 **6.2 Mandatory Requirements**

1920 6.2.1 Compliance with the Lighting Quantity and Quality Parameters. The lighting quantity and quality parameters
1921 for respective application areas shall be in compliance with the latest version of IS 3646 – Part 1

1922 **6.2.2 Interior Lighting Control**

1923 **6.2.2.1 Automatic Lighting Shutoff**

1924

1925 At least 90% of all the interior lighting fixtures by wattage in building shall be equipped with automatic
1926 control device that shall function on either:

- 1927 a) A scheduled basis at specific programmed times. An independent program schedule shall be provided
1928 for areas of up to and including 2,500 m² and not more than one floor, or,
1929 b) Occupancy sensors that shall turn off/ dim (by at least 80% of full light output) the lighting fixtures within
1930 15 minutes of a space becoming un-occupied. Light fixtures controlled by occupancy sensors shall have
1931 a wall-mounted, manual switch capable of turning on/off lights when the space is occupied.

1932 Exception to 6.2.2.1:

1933 1. Lighting required for 24/7 continuous operation.

1934 2. Lighting in spaces where patient care is rendered.

1935 3. *General lighting and task lighting in spaces where automatic lighting shutoff would endanger the*
1936 *safety or the security of occupants in the space.*

1937 **6.2.2.2 Space Control**

1938 (a) Each space enclosed by ceiling-height partitions shall have at least one control device to independently
1939 control the general lighting within the space. Each control device shall be activated either manually by
1940 an occupant or automatically by sensing an occupant. Each control device shall

1941 i. control a maximum of 250 m² for a space less than or equal to 1,000 m², and a maximum of
1942 1,000 m² for a space greater than 1,000 m².

1943 ii. offices greater than 30 m², shall have the following requirements:

1944 1. Control zones for general lighting shall be limited to 60 m².

- 1945 2. Control zones for general lighting shall be permitted to automatically turn on, up to full
 1946 power upon occupancy.
 1947 3. General lighting in other unoccupied control zones shall be permitted to automatically
 1948 turn on to no more than 20% of full power.
- 1949 iii. No more than 50% of the lighting power for the general lighting shall be allowed to be
 1950 automatically turned-on (using programable controls for scheduled operation) and none of
 1951 remaining lighting turned on beyond 20% of full power if unoccupied.
- 1952 iv. have the capability to override the shutoff control specified in 6.2.2.1 for a maximum of 2
 1953 hours, and
- 1954 v. be readily accessible and located so the occupants can see the control.
 1955

1956 (b) Occupancy sensors shall be provided in

- 1957 i. All habitable spaces less than 30 m², enclosed by walls or ceiling height partitions.
 1958 ii. All storage or utility spaces more than 15 m².
 1959 iii. Public toilets more than 25 m², controlling at least 80 % of lighting fixtures by wattage, fitted
 1960 in the toilet. The lighting fixtures, not controlled by automatic lighting shutoff, shall be
 1961 uniformly spread in the area.
- 1962 iv. Corridors of all Hospitality buildings, controlling minimum 70% and maximum 80% of
 1963 lighting fixtures by wattage fitted in the public corridor. The lighting fixtures, not controlled
 1964 by automatic lighting shut off, shall be uniformly spread in the area.
- 1965 v. All conference or meeting rooms.
 1966

1967 Exception to 6.2.2.2 (a) v: The required control device may be remotely installed if required for reasons of
 1968 safety or security. A remotely located device shall have a pilot light indicator as part of or next to the control
 1969 device and shall be clearly labelled to identify the controlled lighting.

1970 **6.2.2.3** *Control in Daylight Areas*

1971 (a) Luminaires, installed within day lighting extent from the window as calculated in 4.2.3, shall be equipped
 1972 with either a manual control device to shut off luminaires, installed within day lit area, during potential
 1973 daylit time of a day or automatic control device that:

- 1974 i. Has a delay of minimum 5 minutes, and,
 1975 ii. Can switch off the light fixtures or dim/step down up to 10% of full power.

1976 When automatic control device in daylight area is provided, manual overrides shall not be allowed.

1977 **6.2.3** Exterior Lighting Control

1978 (a) Lighting for all exterior applications shall be controlled by a photo sensor or astronomical time control
 1979 that is capable of automatically turning off the exterior lighting when daylight is available or the lighting
 1980 is not required.

1981 (b) Façade lighting and façade non-emergency signage of buildings shall have separate time control.

1982 Exemption to 6.2.3: Exterior Lighting systems designed for emergency and firefighting purposes.

- 1983 **6.2.4** Controls for ECSBC+ and Super ECSBC Buildings
- 1984 ECSBC+ and Super ECSBC building(s) shall have centralized lighting control system with at least ~~one or~~
- 1985 ~~more of the~~ following features –
- 1986 a) Complete control of internal and external luminaires- switching on/off or dimming and scheduling of
- 1987 individual or group of luminaires
- 1988 b) Space occupancy feedback from occupancy sensors
- 1989 c) Luminaire failure feedback (individual/group) for maintenance
- 1990 d) Energy monitoring (separately for internal and external lighting)
- 1991 e) Interoperability with the BMS/BEMS

1992 **6.2.5** Additional Control

1993 The following lighting applications shall be equipped with a control device to control such lighting

1994 independently of general lighting:

- 1995 (a) Display/ Accent Lighting: Separate controls shall be provided for display or accent lighting in areas 300
- 1996 m² and above,
- 1997 (b) Hotel Guest Room Lighting: Guest rooms and guest suites in a hotel shall have a master control device
- 1998 at the main room entry that controls all permanently installed luminaires and switched receptacles.
- 1999 (c) Task Lighting. Supplemental task lighting including permanently installed under shelf or under cabinet
- 2000 lighting shall have a control device integral to the luminaires or be controlled by a wall-mounted control
- 2001 device provided the control device complies with 6.2.2.2.
- 2002 (d) Nonvisual Lighting: A separate control device shall be provided for Lighting for nonvisual applications,
- 2003 such as plant growth and food-warming.
- 2004 (e) Demonstration Lighting: A separate control device accessible to authorized personnel only shall be
- 2005 provided for Lighting equipment used for sale or for demonstrations in lighting education.

2006 **6.2.6** Exit Signs

2007 Internally illuminated exit signs shall not exceed 5 Watts per face.

- 2008 **6.2.7** Lighting Power
- 2009 (a) The Connected lighting power of exterior lighting applications shall not exceed the lighting power limits
- 2010 specified in section 6.3.5 for 'ECSBC Buildings' excluding the luminaires/application provided with
- 2011 exemptions in the section 6.3.5.
- 2012 (b) External Luminaires (excluding lighting chains or direct view luminaires) emitting white light with CCT
- 2013 (correlated colour temperature) ranging from 2700 K – 6500 K for all exterior applications (except
- 2014 decorative/architectural) shall have efficacy not less than 100 lumens per watt, 110 lumens per watt,
- 2015 and 120 lumens per watt for ECSBC, ECSBC+, and Super ECSBC Buildings respectively.

2016 **6.3 Prescriptive Requirements**

2017 **6.3.2** Interior Lighting Power

2018 The installed interior lighting power for a building or a separately metered or permitted portion of a building

2019 shall be calculated in accordance with 6.3.4 and shall not exceed the interior lighting power allowance

2020 determined in accordance with either 6.3.2 or 6.3.3.

2021 Exception to 6.3: The following lighting equipment and applications shall not be considered when

2022 determining the interior lighting power allowance, nor shall the wattage for such lighting be included in the

2023 installed interior lighting power. However, any such lighting shall not be exempt unless it is an addition to

2024 general lighting and is controlled by an independent control device.

- 2025 (a) Display or accent lighting that is an essential element for the function performed in galleries,
- 2026 museums, and monuments,
- 2027 (b) Lighting that is integral to equipment or instrumentation and is installed by its manufacturer,
- 2028 (c) Lighting specifically designed for medical or dental procedures and lighting integral to medical
- 2029 equipment,
- 2030 (d) Lighting integral to food warming and food preparation equipment,
- 2031 (e) Lighting for plant growth or maintenance,
- 2032 (f) Lighting in spaces specifically designed for use by the visually impaired,
- 2033 (g) Lighting in retail display windows, provided the display area is enclosed by ceiling-height partitions,
- 2034 (h) Lighting in interior spaces that have been specifically designated as a registered interior historic
- 2035 landmark,
- 2036 (i) Lighting that is an integral part of advertising or directional signage,
- 2037 (j) Exit signs,
- 2038 (k) Lighting that is for sale or lighting educational demonstration systems,
- 2039 (l) Lighting only comprising of theatrical purposes, including performance, stage, and film or video
- 2040 production, and
- 2041 (m) Athletic playing areas with permanent facilities for television broadcasting.

2042 **6.3.3 Building Area Method**

2043 Determination of interior lighting power allowance (watts) by the building area method shall be in
 2044 accordance with the following:

- 2045 (a) Determine the allowed lighting power density (LPD) for each appropriate building area type from Table
- 2046 6-1 for ECSBC Buildings, from Table 6-2 for ECSBC+ Buildings and from Table 6-3 for Super ECSBC
- 2047 Buildings.
- 2048 (b) Calculate the gross illuminated lighted area for each building area type.
- 2049 (c) The interior lighting power allowance is the sum of the products of the gross lighted floor area of each
- 2050 building area times the allowed lighting power density for that building area type.
- 2051

2052 Table 6-1 Interior Lighting Power for ECSBC Buildings – Building Area Method for Lighting system

| Building Area Type | LPD (W/m ²) | Building Area Type | LPD (W/m ²) |
|-----------------------------|-------------------------|-------------------------|-------------------------|
| Office Building | 7.37 | Motion picture theater | 5.06 |
| Hospitals | 10.89 | Museum | 6.6 |
| Hotels /Motel | 6.27 | Post office | 7.48 |

| Fire station | 5.4 | Automotive facility | 7.11 |
| Gymnasium | 7.29 | Convention centre | 6.12 |
| Manufacturing facility | 7.92 | Parking garage | 1.62 |

2057 **6.3.4** Space Function Method

2058 Determination of interior lighting power allowance (watts) by the space function method shall be in
 2059 accordance with the following:

- 2060 (a) Determine the numbers of Light fixtures to meet the lighting quantity and quality parameters.
- 2061 (b) Determine the appropriate building type and the allowed lighting power density from Table 6-4 for
 2062 ECSBC Buildings, Table 6-5 for ECSBC+ Buildings and, Table 6-6 for SuperECSBC Buildings. In cases
 2063 where both a common space type and building specific space type are listed, building specific space
 2064 type LPD shall apply.
- 2065 (c) For each space, enclosed by partitions 80% or greater than ceiling height, determine the gross
 2066 lighted floor area by measuring to the centre of the partition wall. Include the area of balconies or
 2067 other projections. Retail spaces do not have to comply with the 80% partition height requirements.
- 2068 (d) The interior lighting power allowance is the sum of the lighting power allowances for all spaces. The
 2069 lighting power allowance for a space is the product of the gross lighted floor area of the space times
 2070 the allowed lighting power density for that space.

2071 (e) Room Geometry Adjustment

2072 When using the space-by-space Method, an adjustment of the space LPD allowance is permitted for
 2073 individual spaces where room cavity ratio (RCR) calculated for the empty room is documented to be greater
 2074 than the RCR threshold for that space type shown in interior lighting power allowance tables.

2075 $RCR = 2.5 \times \text{room cavity height} \times \text{room perimeter length} / \text{room area}$

2076
 2077 Where,

2078
 2079 $\text{Room cavity height} = \text{luminaire mounting height} - \text{work plane height}$

2080
 2081 For corridor/transition spaces, this adjustment is allowed when the corridor is less than 2.4 m wide,
 2082 regardless of the RCR. The LPD allowance for these spaces may be increased which is determined using the
 2083 following equation:

2084
 2085 $LPD \text{ Increase} = \text{Base Space LPD} \times 0.20$

2086 Note: RCR sample calculation for an enclosed office room example provided below

2094 Sample

calculation for Room Cavity

2095 Ratio for an Office Cabin

2096 From the figure above

2097 Room length (L) = 5m

2098 Room breadth (W) = 3m

2099 Room Height (H) = 4 m

2100 Working Plane Height (H_{wp}) = 0.8m

2101 Luminaire Suspension Height (H_{susp}) = 1 m

2102 Room Cavity Height (H_{rc})

2103 = Room Height- Luminaire Suspension Height- Working Plane Height

2104 = ($H - H_{wp} - H_{susp}$)

2105 = ($4 - 1 - 0.8$) m = 2.2 m

2106 Room perimeter length = $2 \times (L + W) = 2 \times (5 + 3) = 16$ m

2107 Room area = $L \times W = 5 \times 3 = 15$ m²

2108 Room Cavity Ratio (RCR) = $2.5 \times$ room cavity height \times room perimeter length / room area

2109 = $(2.5 \times 2.2 \times 16) / 15$

2110 = 5.87

2111 As per table 6.2 for Enclosed Office < 13.9 m², the reference RCR is 8 RCR. There is no additional LPD
2112 allowed for the example shown above

2113 a) Allowance for tunable white lighting- If any regularly occupied space has got >80% of the lighting
2114 fixtures that can emit tunable white Light, then additional 10% of interior lighting power allowance
2115 on the base space LPD is allowed.

- 2116 b) For spaces in which lighting is installed for the purpose of video conferencing, additional lighting
 2117 power allowance of 5.38 W/m² is allowed.

2118 Table 6-4 Interior Lighting Power for ECSBC Buildings – Space Function Method Base LPD without modifiers

A four-story building has retail on the ground floor and offices on the top three floors. Area is 3,598 m². Space types and their respective areas are mentioned below. Steps for calculating interior lighting power allowance using the space function method for a ECSBC building is described below.

For each of the space type, corresponding Lighting Power Density (LPD) values for Business and Shopping complex building type from Table 6-4 are used. Area is multiplied with the LPD values to estimate the lighting power allowance for the whole building. It is 34,003 W.

Table 6-1-1 Space Types, Areas and Corresponding LPDs

| Space Function | LPD (W/ m ²) | Area (m ²) | Lighting Allowance (W) | Power |
|---|--------------------------|------------------------|------------------------|---------------|
| Office | | | | |
| Office – enclosed (>13.9m ² and <27.9 m ²) | 7.81 | 720 | | 5,623 |
| Office – open plan (>27.9m ²) | 6.6 | 1,485 | | 9,801 |
| Meeting Rooms | 10.45 | 120 | | 1,254 |
| Lobbies | 9.46 | 93 | | 880 |
| Restrooms | 8.8 | 51 | | 449 |
| Corridors | 5.28 | 125 | | 660 |
| Electrical/ Mechanical | 8.36 | 14 | | 117 |
| Staircase | 5.5 | 84 | | 462 |
| Total | | | | 19,246 |
| Retail | | | | |
| General sales area | 10.01 | 669 | | 6,697 |
| Offices – enclosed (<13.9m ²) | 8.69 | 28 | | 243 |
| Restrooms | 8.8 | 9 | | 79 |
| Corridors | 5.28 | 79 | | 417 |
| Storage (≥4.6m ²) | 4.18 | 93 | | 389 |
| Food preparation | 11.4 | 28 | | 319 |
| Total | | | | 14,124 |
| Building Total | | | | 34,003 |

2125 **6.3.5** Installed Interior Lighting Power

2126 The installed interior lighting power calculated for compliance with §6.3 shall include
2127 total ~~all~~ power consumption of the luminaires, except the exemptions specified in
2128 §6.1.

2129 Exception to §6.3.4: If two or more independently operating lighting systems in a
2130 space are controlled to prevent simultaneous user operation, the installed interior
2131 lighting power shall be based solely on the lighting system with the highest power
2132 without compromising the lighting quantity and quality.

2133 **6.3.5.1** *Luminaire Wattage*

2134 The wattage of lighting equipment, when used to calculate either installed interior
2135 lighting power or installed exterior lighting power, shall be determined in accordance
2136 with the following criteria:

- 2137 a) The wattage of lighting equipment connected to supply voltage shall be
2138 the manufacturers' labelled rated wattage.
- 2139 b) The wattage of lighting equipment with remote ballasts/drivers or similar
2140 devices shall be the total input wattage of all components and accessories in
2141 the system.
- 2142 c) The wattage of all other miscellaneous luminaire types not described in (a) or
2143 (b) shall be the rated wattage marked on the luminaires and/or its packaging.
- 2144 d) The wattage of lighting track, plug-in busway, and flexible-lighting systems
2145 that allow the addition and/ or relocation of luminaires without altering the
2146 wiring of the system shall be the highest of the specified wattage of the
2147 luminaires included in the system or 135 Watt per meter length of the lighting
2148 system. Systems with integral overload protection, such as fuses or circuit
2149 breakers, shall be rated at 100% of the maximum rated load of the limiting
2150 device.

2151 **6.3.6** Exterior Lighting Power

2152 Connected lighting power of exterior lighting applications shall not exceed the lighting
2153 power limits specified in Table 6-7 for ECSBC Buildings, Table 6-8 for ECSBC+ Buildings
2154 and Table 6-9 for Super ECSBC Buildings. Trade-offs between applications are not
2155 permitted.

2156 Exception to exterior lighting power

- 2157 a) Emergency lighting for hospitals including hospital signage.
- 2158 b) Any signage which is mandatory by law /regulations

- 2159 c) Lighting integral to equipment or instrumentation and installed by its
 2160 manufacturer.
 2161 d) Theatrical purposes only comprising of performance, stage, film production,
 2162 and video production.
 2163 e) Temporary lighting not permanently installed and can be removed or shifted
 2164 whenever required.
 2165 f) Lighting for industrial activities namely manufacturing, material handling,
 2166 transportation sites, and associated storage areas where lighting is equipped
 2167 with hoods or louvers for glare control.
 2168 g) Lighting for any monument of national importance, national flag,
 2169 statue/sculpture etc.

2170 Table 6-7 Exterior Building Lighting Power for ECSBC Buildings

| Exterior lighting application | Power limits |
|--|--|
| Building entrance (with canopy) | 10 W/m ² of canopied area |
| Building entrance (w/o canopy) | 90 W/ linear m of door width |
| Building exit | 60 W/lin m of door width |
| Building façade | 5.0 W/m ² of vertical façade area |

2200 *SYSTEMS*

2201

DRAFT FOR STAKEHOLDER CONSULTATION

2202 **7.1 General**

2203 All electric, Vertical Transport and renewable energy equipment and systems shall
2204 comply with the mandatory requirements of §7.2.

2205 **7.2 Mandatory Requirements**

2206 **7.2.1 Transformers**

2207 **7.2.1.1 Maximum Allowable Distribution Transformer Losses**

2208

2209 Power distribution transformers of the required ratings and design shall satisfy the
2210 maximum allowable losses at 50% and 100% loading. The permissible loss shall not
2211 exceed the values listed in IS 1180 first published in 2014 and latest amendment 4
2212 issued in 4th march 2021 titled as IS 1180 (PART 1) : 2014 and IS 1180 (Part 3) : 2021
2213 or as revised from time to time for Mineral Oil type or Ester Oil type transformer
2214 respectively and shall conform to BEE star rating.

2215

2216 Dry type transformers shall conform to permissible losses as indicated in Table 7.1

2217

2218 Compliance of Power distribution transformers shall be:

2219

- 2220 (a) ECSBC building – Conforming to BEE 3-star labelling requirement.
- 2221 (b) ECSBC Plus building – Conforming to BEE 4-star labelling requirement.
- (c) ECSBC Super building – Conforming to BEE 5-star labelling requirement.

Table 7-1 Dry Type Transformers

| Rating (kVA) | Impedance (%) | Max. Total Loss (W) | | | | | |
|-----------------|------------------|---------------------|--------------|----------------|--------------|--------------------|--------------|
| | | ECBC Building | | ECBC+ Building | | SuperECBC Building | |
| | | 50 % Load | 100% Load | 50 % Load | 100% Load | 50 % Load | 100% Load |
| 16 | 4.5 | 150 | 480 | 135 | 440 | 120 | 400 |
| 25 | 4.5 | 210 | 695 | 190 | 635 | 175 | 595 |
| 63 | 4.5 | 380 | 1,250 | 340 | 1,140 | 300 | 1,050 |
| 100 | 4.5 | 520 | 1,800 | 475 | 1,650 | 435 | 1,500 |
| 160 | 4.5 | 770 | 2,200 | 670 | 1,950 | 570 | 1,700 |
| 200 | 4.5 | 890 | 2,700 | 780 | 2,300 | 670 | 2,100 |
| 250 | 4.5 | 1,050 | 3,150 | 980 | 2,930 | 920 | 2,700 |
| 315 | 4.5 | 1,100 | 3,275 | 1,025 | 3,100 | 955 | 2,750 |
| 400 | 4.5 | 1,300 | 3,875 | 1,225 | 3,450 | 1,150 | 3,330 |
| 500 | 4.5 | 1,600 | 4,750 | 1,510 | 4,300 | 1,430 | 4,100 |
| 630 | 4.5 | 2,000 | 5,855 | 1,860 | 5,300 | 1,745 | 4,850 |
| 1000 | 5 | 3,000 | 9,000 | 2,790 | 7,700 | 2,620 | 7,000 |
| 1250 | 5 | 3,600 | 10,750 | 3,300 | 9,200 | 3,220 | 8,400 |
| 1600 | 6.25 | 4,500 | 13,500 | 4,200 | 11,800 | 3,970 | 11,300 |
| 2000 | 6.25 | 5,400 | 17,000 | 5,050 | 15,000 | 4,790 | 14,100 |
| 2500 | 6.25 | 6,500 | 20,000 | 6,150 | 18,500 | 5,900 | 17,500 |

Total loss values given in above table are applicable for thermal classes E, B and F and have component of load loss at reference temperature according to Clause 17 of IS. An increase of 7% on total for thermal class H is allowed.

2222
2223
2224
2225
2226
2227
2228
2229
2230

- a) The permissible loss value shall be superseded by the values as specified in the Indian standard whenever published.
- b) EEL - Energy Efficiency Level
- c) The values in this table have been developed based on input data sourced from IEC 60076-20. 100% losses from Level 1 to Level 3 are calculated considering the individual losses (No Load Loss and Load Loss) as mentioned in table 10 of IEC 60076-20. 50% losses are computed. Loss level 1 as per IEC recommended level 1, Level 3 as per IEC recommended level 2 & intermediate levels are extrapolated.

2231
2232 d) Total loss values given in table 7.1 are applicable for thermal insulation class F.
2233 The reference temperature for calculation of performance (Losses and impedance
2234 etc may be the maximum or average ambient temperature plus the temperature
2235 rise limit as per the insulation class of the Dry Type Transformer (for example 120
2236 Deg C for insulation Class F) - refer table 2 and Clause No. 14.2.3 of IS - 2026 Part
11:2021 for Dry type transformer.

2237 For transformers having voltage class above 11 kV and up to and including 22 kV,
2238 the permissible total loss values shall not exceed by 5% of the maximum total loss
2239 values mentioned in above Table.

2240 For transformers having primary highest voltage for equipment $22\text{kV} < U_m \leq 33\text{kV}$
2241 and Secondary highest voltage for equipment $U_m \leq 3.6\text{ kV}$, the permissible total
2242 loss values shall not exceed by 15% of the maximum total loss values mentioned
2243 in above Table. Here U_m is highest voltage for equipment.

2244
2245 e) Transformer ratings above 3150 kVA, shall conform to values specified in IS 2026
latest version will be applicable.

2246 7.2.1.2 Measurement and Reporting of Transformer Losses

2247 All measurement of losses shall be carried out by using calibrated digital meters of
2248 class 0.5 or better accuracy and shall be certified by BIS certification mark and BEE
2249 label. All transformers of capacity of 500 kVA and above shall be equipped with
2250 appropriate class energy meters and current transformers (CTs) and potential
2251 transformers (PTs) in addition to requirements of utilities for periodic loss monitoring
2252 study.

2253 7.2.1.3 Voltage Drop

2254 Voltage drop for any feeders shall be maximum 2% at design load. Voltage drop for
2255 any branch circuit shall be maximum 3% at design load.

2256 7.2.2 Energy Efficient Motors

2257 Motors shall comply with the following:

2258 Three phase induction motors shall conform to (IS) 12615 latest version as amended
2259 from time to time and shall fulfil the following efficiency requirements:

- 2260
- 2261 i. ECSBC Buildings shall have motors of minimum IE 3 (high efficiency) class
 - 2262 ii. ECSBC+ Buildings shall have motors of minimum IE 4 (premium efficiency)
 - 2263 iii. Super ECSBC Buildings shall have motors of minimum IE 5 (super premium
efficiency) class

2264 NOTE:

2265

- 2266 i) IE5 efficiency class is as defined in IEC TS 60034-30-2
- 2267 ii) Motors of kW ratings different from those listed in the tables of IS 12615 shall
- 2268 have efficiency greater than that of the next listed kW motor.
- 2269 iii) Motor kW ratings shall not exceed 20% of the calculated maximum load being served.

2270 7.2.3 Standby Generator Sets

2271 BEE star rated DG sets (as per prevalent BEE Standards and Labelling Program) shall
2272 be used in all compliant buildings. DG sets in buildings greater than 20,000 m² Built
2273 Up Area (BUA) shall be BEE star labelled and

2274

- 2275 a) ECSBC compliant building – Minimum BEE 3 stars rating
- 2276 b) ECSBC Plus compliant building – Minimum BEE 4 stars rating
- 2277 c) ECSBC Super compliant building – 5 stars rating in Super ECSBC Buildings

2277

2278 Note: Provided Standby Generating sets, using any other fuels other than diesel, shall
2279 comply with BEE's star labelling program as and when comes into effect. The
2280 buildings not using DG sets for captive power generation (no more than 15% of power
2281 requirement is being met using DG sets), BEE 3 star rated DG sets shall be used for
2282 ECSBC Plus and ECSBC Super compliance.

2283

2284 7.2.4 Check-Metering and Monitoring

2285 At Building mains, installed meters shall monitor Energy use (kWh, kVARh, kVAh),
2286 Energy Demand (kW/ kVA), THD (V and I) on a half hour basis. The metering shall also
2287 be displaying current (in each phase and the neutral), voltage (between phases and
2288 between each phase and neutral).

2289 *Need of KVARh metering Explanation:* Reactive Power influences the power factor of
2290 the system. We know 'Power factor' is a key indicator for an efficient energy delivery
2291 in AC electrical system. It is a measure of how effectively a specific load consumes
2292 electricity to produce work. So, understanding reactive power consumption in highly
2293 no linear load driven electrical system helps user to decide on efficient utilisation of
2294 energy, avoid utility penalty and reduce MD in the system.

2295 Building services sub-meters shall comprise of the following:

- 2296
2297 (a) Services 1,000 kVA and above shall have permanently installed electrical
2298 metering to record demand (kVA), energy (kWh), and total power factor on
2299 half hourly basis. The metering shall also display current (in each phase and
2300 the neutral), voltage (between phases and between each phase and neutral),
2301 and total harmonic distortion (THD) as a percentage of total current and
2302 voltage.
- 2303 (b) Services 65kVA to 1,000 kVA shall have permanently installed electric
2304 metering to record demand (kW/kVA), energy (kWh/kVAh), and total power
2305 factor (or kVARh) on half hourly basis.
- 2306 (c) Services less than 65 kVA shall have permanently installed electrical metering
2307 to record energy (kWh) on hourly basis.
- 2308 (d) Submetering for building services shall be as defined in Table 7.2
(e) Submetering for specific building types shall be as defined in Table 7.3.

2309 **7.2.4.1** All installed energy meters shall conform to IS 13779 and shall be Class 0.2s
2310 or higher accuracy for building-level metering and Class 1s for sub-metering and have
2311 an active RS-485 port, with industry standard Modbus protocol. For power quality
2312 measurement at building-level, the energy meter located in PCC shall be class A as
2313 per IEC 61000-4-7 and IEC 61000-4-30..

2314 Sub-metering requirements for different services shall be as defined in Table 7-2 and
2315 additional sub-metering for specific building types shall be as defined in Table 7.3

2316 *Table 7-2 Sub Metering: Minimum requirement for separation of electrical load*

| | <i>Building Contract Demand</i> | |
|---------------------------------------|---------------------------------|-----------------------------|
| | <i>120 kVA to 250 kVA</i> | <i>Greater than 250 kVA</i> |
| HVAC system and components | Required | Required |
| Interior and Exterior Lighting | Not required | Required |
| Domestic hot water | Not required | Required |
| Plug loads | Not required | Required |
| Renewable power source | Required | Required |
| Public Health Engineering (PHE) Pumps | Not required | Required |
| Sewage Treatment Plant (STP) | Required | Required |

| | | |
|-----------------------------|----------|----------|
| Water Treatment Plant (WTP) | Required | Required |
|-----------------------------|----------|----------|

2317 **Table 7-3 Additional sub-metering requirements for specific building types**

| <i>Mandatory requirement of sub-metering of services for specific building types</i> | |
|--|---|
| Shopping Complex | Façade lighting, Common Area lighting and exterior lighting |
| Shopping Complex | Elevator, escalators & moving walks |
| Business | Data centres and Floor loads |
| Hospitality | Commercial kitchens, laundry & Total Guest rooms |
| Hospital | Medical Equipment, UPS power, total IPD rooms, Kitchen, and Laundry |

2318 **7.2.4.2** For tenant-based building, tenants must be provided with tap-off points to
 2319 install electrical sub-meters.

2320 **7.2.4.3** Energy metering & monitoring system installed in the building shall be
 2321 capable of catering to all the commissioning and measurement & verification (M&V)
 2322 aspects related to various utilities in the building as described below.

- 2323
 2324 a. Energy monitoring system with metering at LT panel with monitoring and
 2325 control parameters available to take corrective action for the performance of
 2326 the system, for ECSBC building.
 2327 b. Monitoring-based commissioning (MBCx) procedure with sub metering to
 2328 measure, monitor and assess performance of all points of utility consumption,
 2329 for ECSBC plus building.
 2330 c. MBCx + Advanced Measurement & Verification (M&V 2.0) infrastructure for
 2331 ongoing energy performance evaluation, automated M&V, and predictive
 analysis capabilities, for super ECSBC building.

2332 NOTE: commissioning and M&V related requirements shall be adopted as defined in
 2333 Chapter 13 Controls & IoT section.

2334 **7.2.5 Power Factor Correction**

2335 All 3 phase supplies shall maintain their power factor at the point of connection as
 2336 follows:

- 2337 a) 0.97 for ECSBC compliant Building
 2338 b) 0.98 for ECSBC Plus compliant building

2339 c) 0.99 for Super ECSBC Super compliant building

2340 7.2.6 Power Quality

2341 **7.2.6.1 Voltage Distortion**

2342 At the main metering level of the building, utilities and/or distribution system
2343 operators shall limit line-to-neutral voltage harmonics as follows:

2344 a) Daily 99th percentile very short time (3s) values shall be less than 1.5 times the
2345 values given in table 7.4.

2346 b) Weekly 95th percentile short time (10 min) values shall be less than the values
2347 given in table 7.4.

2348 Table 7.4 – Voltage Distortion Limits

| Bus voltage V at PCC | Individual harmonic (%) h ≤ 50 | Total harmonic distortion THD (%) |
|----------------------|-----------------------------------|--------------------------------------|
| V ≤ 1.0 kV | 5.0 | 8.0 |
| 1 kV < V ≤ 69 kV | 3.0 | 5.0 |
| 69 kV < V ≤ 161 kV | 1.5 | 2.5 |
| 161 kV < V | 1.0 | 1.5* |

2349

2350 NOTE: High-voltage systems are allowed to have up to 2.0% THD where the cause is
2351 an HVDC terminal whose effects are found to be attenuated at points in the network
2352 where future users may be connected.

2353 Reference Standard: IEEE 519:2022

2354 **7.2.6.2 Current Distortion**

2355 The limits in this sub clause shall be applicable to users connected to systems with
 2356 the rated voltage at the PCC is from 120 V to above 161 kV. For individual nonlinear
 2357 load, these limits are not applicable. At the PCC (Point of Common Coupling), users
 2358 shall limit their harmonic currents as specified.:

- 2359
 2360 a) Daily 99th percentile very short time (3 s) harmonic currents shall be less than
 2361 2.0 times the values given in Table 7.5, Table 7.6 and Table 7.7
 2362 b) Weekly 99th percentile short time (10 min) harmonic currents shall be less
 2363 than 1.5 times the value given in Table 7.5 and Table 7.6 and Table 7.7.
 2364 c) Weekly 95th percentile short time (10 min) harmonic currents shall be less
 than the values given in Table 7.5 and Table 7.6 and Table 7.7s.

2365 Maximum allowable limit of current distortion for system design shall comply to
 2366 Table 7.5

2367 Table 7.5 Current distortion limits for systems rated 120V through 69kV

2368

| Maximum harmonic current distortion in percent of I_L | | | | | | |
|---|-------------------|------------------|------------------|------------------|---------------------|------|
| Individual harmonic order ^b | | | | | | |
| I_{sc}/I_L | $2 \leq h < 11^a$ | $11 \leq h < 17$ | $17 \leq h < 23$ | $23 \leq h < 35$ | $35 \leq h \leq 50$ | TDD |
| < 20 ^c | 4.0 | 2.0 | 1.5 | 0.6 | 0.3 | 5.0 |
| 20 < 50 | 7.0 | 3.5 | 2.5 | 1.0 | 0.5 | 8.0 |
| 50 < 100 | 10.0 | 4.5 | 4.0 | 1.5 | 0.7 | 12.0 |
| 100 < 1000 | 12.0 | 5.5 | 5.0 | 2.0 | 1.0 | 15.0 |
| > 1000 | 15.0 | 7.0 | 6.0 | 2.5 | 1.4 | 20.0 |

2369

2370

2371

2372

^a For $h \leq 6$, even harmonics are limited to 50% of the harmonic limits shown in the table.

2373

^b Current distortions that result in a dc offset, e.g., half-wave converters, are not allowed.

^c Power generation facilities are limited to these values of current distortion, regardless of actual I_{sc}/I_L unless covered by other standards with applicable scope.

2374

where:

I_{sc} = maximum short-circuit current at PCC

I_L = maximum demand load current at PCC under normal load operating conditions

2375

2376 Table 7.6 Current distortion limits for systems rated above 69 kV through 161kV

| Maximum harmonic current distortion in percent of I_L | | | | | | |
|---|-------------------|------------------|------------------|------------------|---------------------|------|
| Individual harmonic order ^b | | | | | | |
| I_{sc}/I_L | $2 \leq h < 11^a$ | $11 \leq h < 17$ | $17 \leq h < 23$ | $23 \leq h < 35$ | $35 \leq h \leq 50$ | TDD |
| $< 20^c$ | 2.0 | 1.0 | 0.75 | 0.3 | 0.15 | 2.5 |
| $20 < 50$ | 3.5 | 1.75 | 1.25 | 0.5 | 0.25 | 4.0 |
| $50 < 100$ | 5.0 | 2.25 | 2.0 | 0.75 | 0.35 | 6.0 |
| $100 < 1000$ | 6.0 | 2.75 | 2.5 | 1.0 | 0.5 | 7.5 |
| > 1000 | 7.5 | 3.5 | 3.0 | 1.25 | 0.7 | 10.0 |

^a For $h \leq 6$, even harmonics are limited to 50% of the harmonic limits shown in the table.

^b Current distortions that result in a dc offset, e.g., half-wave converters, are not allowed.

^c Power generation facilities are limited to these values of current distortion, regardless of actual I_{sc}/I_L unless covered by other standards with applicable scope.

where

I_{sc} = maximum short-circuit current at PCC

I_L = maximum demand load current at PCC under normal load operating conditions

2377

2378 Table 7.7- Current distortion limits for systems rated > 161 kV

| Maximum harmonic current distortion in percent of I_L | | | | | | |
|---|-------------------|------------------|------------------|------------------|---------------------|------|
| Individual harmonic order ^b | | | | | | |
| I_{sc}/I_L | $2 \leq h < 11^a$ | $11 \leq h < 17$ | $17 \leq h < 23$ | $23 \leq h < 35$ | $35 \leq h \leq 50$ | TDD |
| $< 25^c$ | 1.0 | 0.5 | 0.38 | 0.15 | 0.1 | 1.5 |
| $25 < 50$ | 2.0 | 1.0 | 0.75 | 0.3 | 0.15 | 2.5 |
| ≥ 50 | 3.0 | 1.5 | 1.15 | 0.45 | 0.22 | 3.75 |

^a For $h \leq 6$, even harmonics are limited to 50% of the harmonic limits shown in the table.

^b Current distortions that result in a dc offset, e.g., half-wave converters, are not allowed.

^c Power generation facilities are limited to these values of current distortion, regardless of actual I_{sc}/I_L unless covered by other standards with applicable scope.

where

I_{sc} = maximum short-circuit current at PCC

I_L = maximum demand load current at PCC under normal load operating conditions

2379

2380 Reference Standard: IEEE 519:2022

2381 **All projects shall submit outcome results as per enclosed annexure A enclosed**

2382 **with this document to validate compliance to award**

2383 7.2.7 Power Distribution Systems

2384 The power cabling size shall be designed for distribution losses to be less than values

2385 mentioned as below:

2386

a) 3% of the total power usage in ECSBC compliant Buildings

2387

b) 2% of the total power usage in ECSBC Plus compliant Buildings

2388

c) 1% of total power usage in ECSBC Super compliant Buildings

2389 Design calculation for the losses shall be recorded and maintained. Load calculation
 2390 shall be calculated up to the panel level.

2391 7.2.8 Uninterruptible Power Supply (UPS)

2392 In all buildings, energy efficiency of UPS shall be equal to or higher than energy
 2393 efficiency requirements defined in Table 7-8.

2394 *Table 7-8 Energy Efficiency Requirements for UPS for ECSBC, ECSBC+ Plus ECSBC Super*
 2395 *building*

| <i>UPS Size</i> | <i>Energy Efficiency Requirements at 100% Load</i> |
|-----------------|--|
| kVA < 20 | 93% |
| 20 ≤ kVA ≤ 100 | 94% |
| kVA > 100 | 96% |

2396 *NOTE: Standards and Labelling program by BEE shall take precedence over*
 2397 *requirements listed in this section.*

2398 **7.2.9 Renewable Energy Systems**

2399 All buildings shall have provisions for installation of renewable energy systems.

2400 7.2.9.1 Renewable Energy Generation (REGZ)

2401 The building shall have onsite renewable energy generation capacity in meeting at
 2402 least 4% of total contract demand of the building on annual basis or covering
 2403 minimum of 50% of the available roof area, which ever feasible for ECSBC buildings.
 2404 In addition, the rooftop solar system considered for building, should give yield at least
 2405 0.46 kWh/sqm/yr. or more.

2406 NOTE: m² denotes surface area of the solar panel installed

2407

2408 ECSBC Plus and ECSBC Super building shall fulfil the additional requirements listed in
 2409 Table 7-9 and Table 7-10 respectively.

2410 *Table 7.9 Minimum Renewable Contribution towards meeting Contract Demand in*
 2411 *ECSBC Plus Building*

| <i>Building Type</i> | <i>Minimum Capacity to be Installed in REGZ</i> |
|---------------------------------|---|
| All building types except below | Minimum 7.5% of total Contract Demand |

| | |
|---|---------------------------------------|
| Star Hotel > 20,000 m ² AGA Resort > 12,500 m ² AGA University > 20,000 m ² AGA Business >20,000 m ² AGA | Minimum 7.5% of total Contract Demand |
|---|---------------------------------------|

2412 *Table 7.10 Minimum Renewable Contribution towards meeting Contract Demand in*
2413 *Super ECSBC Building*

| <i>Building Type</i> | <i>Minimum Capacity to be Installed in REGZ</i> |
|---|---|
| All Building types except below | Minimum 15% of total Contract Demand |
| Star Hotel > 20,000 m ² AGA Resort > 12,500 m ² AGA University > 20,000 m ² AGA Business >20,000 m ² AGA | Minimum 15% of total Contract Demand |

2414 *As an alternative compliance path, if states having open access policy, the buildings*
2415 *shall comply in meeting above demand by using combination of off-site green power*
2416 *procured from local energy company along with on-site installed renewable energy*
2417 *sources to meet the target mentioned above.*

2418 **7.2.9.2 Main Electrical Service Panel**

2419 Minimum rating shall be displayed on the main electrical service panel. Space shall
2420 be reserved for the installation of a circuit breaker for a future renewable electric
2421 installation.

2422 **7.2.9.3 Demarcation on Documents**

2423 The following shall be indicated in design and construction documents:

- 2424
- a. Location for inverters and metering equipment
 - 2425
 - 2426 b. Pathway for routing of conduit from the REGZ to the point of interconnection with the electrical service
 - 2427
 - c. Routing of plumbing from the REGZ to the water-heating system and
 - 2428
 - d. Structural design loads for roof dead and live load.

2429

2430 7.2.9.4 Grid Harmonisation / Demand Response

2431

2432 All buildings should conform to

2433

2434 a) ECSBC -Minimum 5% Building Electricity Peak Demand load reduction capability

2435

2436 b) ECSBC Plus 7.5 % Building Electricity Peak Demand load reduction capability

2437

2437 c) Super ECSBC – 10 % Building Electricity Peak Demand load reduction Capability.

2438

2439 7.2.9.5 Recommendations on Electric Vehicle Charging Infrastructure and Parking

2440 Spaces

2441

a) **EV Charging Infrastructure:**

2442 Parking places in buildings shall be provided with EV Charging infrastructure as per

2443 following Central Electricity Authority (CEA) guidelines, CEA measures of safety

2444 regulations and Ministry of power consolidated guidelines & standards for EV

2445 charging infrastructure as applicable at the time of implementation.

2446

2447 a) CEA Measures Relating to Safety and Electric Supply, Amendment Regulations, 2019

2448

2449 b) CEA Technical Standards for Connectivity of Distributed Generation Resources, Amendment Regulations, 2019

2450

2451 c) Ministry of Power Guidelines, Jan 2022

2452

2453 d) BIS standards (IS 17017 series)

2454

2454 e) Battery Safety and Vehicle Safety standards for EV as per regulations by Ministry of Heavy Industries.

2455 f) Amendments to Model Building Bye-Laws 2016 for EVCI, 2019

2455 1. ECSBC: Minimum 20% parking capacity with EV charging facility. The requirements shall comply independently for two wheelers, four wheelers and visitors parking.

2456 2. ECSBC Plus: Minimum 25% parking capacity with EV charging facility. The requirements shall comply independently for two wheelers, four wheelers and visitors parking.

2460

2461 3. Super ECSBC: Minimum 35% parking capacity with EV charging facility. The
 2462 requirements shall comply independently for two wheelers, four wheelers and
 2463 visitors parking.

2464 NOTE: The parking space shall comply with all the safety requirements for EVs

2465 **7.2.10 Vertical Transportation System**

2466 **7.2.10.1 Mandatory requirement:**

2467 Vertical transportation shall comply to the standard in table 7.11:

2468 Table 7.11: Standards for vertical transportation system

| SL no | IS No. | Title |
|-------|----------------|---|
| 1 | 17515 (Part 1) | Energy Performance of Lifts, Escalators and Moving Walks: Part 1 Energy Measurement and Verification |
| 2 | 17515 (Part 2) | Energy Performance of Lifts, Escalators and Moving Walks: Part 2 Energy Calculation and Classification for Lifts (Elevators) |
| 3 | 17515 (Part 3) | Energy Performance of Lifts, Escalators and Moving Walks: Part 3 Energy Calculation and Classification of Escalators and Moving Walks |

2469

2470 The lifts shall be of energy classification 'C' efficient for ECSBC buildings, energy

2471 classification 'B' efficiency for ECSBC plus buildings and energy classification 'A'

2472 efficiency for ECSBC super buildings. The energy classification values are as defined in

2473 table 7 of IS 17515 – Part 2.

| Energy efficiency class | Energy consumption per day (Wh) |
|-------------------------|---|
| A | $E_d \leq 0,72 \times Q \times n_d \times s_{av} / 1\ 000 + 50 \times t_{nr}$ |
| B | $E_d \leq 1,08 \times Q \times n_d \times s_{av} / 1\ 000 + 100 \times t_{nr}$ |
| C | $E_d \leq 1,62 \times Q \times n_d \times s_{av} / 1\ 000 + 200 \times t_{nr}$ |
| D | $E_d \leq 2,43 \times Q \times n_d \times s_{av} / 1\ 000 + 400 \times t_{nr}$ |
| E | $E_d \leq 3,65 \times Q \times n_d \times s_{av} / 1\ 000 + 800 \times t_{nr}$ |
| F | $E_d \leq 5,47 \times Q \times n_d \times s_{av} / 1\ 000 + 1\ 600 \times t_{nr}$ |
| G | $E_d > 5,47 \times Q \times n_d \times s_{av} / 1\ 000 + 1\ 600 \times t_{nr}$ |

2474

2475 **Escalator and /or Moving Walks** : Energy calculations and classification for Escalators

2476 and Moving walks is based on Table 7.12 of IS 17515 - Part 3

| Energy performance ratio | ≤55% | ≤60% | ≤65% | ≤70% | ≤80% | ≤90% | ≤100% | >100% |
|------------------------------------|------|------|------|------|------|------|-------|-------|
| Energy performance class indicator | A+++ | A++ | A+ | A | B | C | D | E |

2477

2478
2479 Note: If there are multiple lifts in a building with different classification as per table
2480 above, then the one with lowest class shall be taken for rating computation.

2481 The escalators shall be energy classification 'A+ efficiency' for ECSBC buildings, energy
2482 classification 'A++ efficiency' for ECSBC plus buildings and energy classification 'A+++
2483 efficiency' for ECSBC super buildings. The energy classification values are as defined
2484 in table 7 of IS 17515 – Part 3.

2485 *Note: If there are multiple escalators and /or moving walks in a building with different*
2486 *classification as per table above, then the one with lowest class shall be taken for*
2487 *rating computation.*

2488 **7.2.10.2 Prescriptive requirements:**

2489 Lifts shall have Variable frequency drives, Permanent magnet gearless machines and
2490 Energy efficient lighting features with standby mode and prescriptive features like
2491 Destination control system where applicable as per traffic analysis requirements,
2492 Regenerative drives, and Internet of things for Predictive maintenance.

2493 Escalators and Moving walks shall have Variable frequency drives, load and motion
2494 sensors for better efficiency and Energy efficient lighting features and soft start
2495 capabilities, Internet of Things enabled controls for predictive maintenance.
2496 Regenerative Drives shall be provided to recycle energy. All signal/ signages used for
2497 these equipment's shall be of LED fixtures.

Section 8

ECSBC – WATER MANAGEMENT AND CONTROLS

DRAFT FOR STAKEHOLDER CONSULTATION

2506 **8.1 General**

2507 The basic objective of this Chapter is to ensure the sustainable management of water
2508 and its availability. The emphasis is on reducing the usage of water through use of
2509 water efficient products and techniques and encourage the reuse and recycling of
2510 the treated wastewater. As the water footprint gets reduced so will the energy as
2511 most of the energy required is spent on transporting, treating and heating of water.

2512

2513 All ECSBC compliant buildings shall conform to §8.2, §8.3, §8.4, §8.5 §8.6, §8.7 §8.8
2514 and §8.9

2515

2516 **8.1.1 Mandatory requirements**

2517 Following pre-requisites need to be followed for all building types:

2518

2519 8.1.1.1 Source of Water:

2520 The source of water shall be reliable and must have the potential to cater for the
2521 water supply during the lifetime of the building ~~entire life of the building~~. The
2522 different sources of water are:

2523

- 2524 a) Municipal / Public utility supplying potable water: One of the primary sources
2525 of fresh water supply.
- 2526 b) Bore-well / Open-well: Installation of bore-well/open well shall be with due
2527 approval from concerned regulatory authorities, in absence of adequate
2528 municipal supply and shall be supported by documentary evidence.
- 2529 c) Bought out potable water in tankers: when no other source is available or
2530 when municipal or well water is inadequate.
- 2531 d) Reclaimed used water from sewage treatment plants for non-potable usages.
- 2532 e) Harvested rainwater to be used for non- potable use and potable use after
2533 treatment.
- 2534 f) Desalination of water for potable & non-potable use shall be allowed after
2535 obtaining approval from concerned authorities.

2536 Exception to 8.1.1.1 d: Reuse of reclaimed water in Hospital and Outpatient Health
2537 care is not recommended due to associated health hazards.

2538

2539

2540 **8.1.2 Water Efficiency Levels**

2541 The code prescribes the following three levels of water efficiency:

- 2542 a) ECSBC compliant buildings shall conform to the mandatory and prescriptive
2543 requirements listed under ECSBC Compliant Building requirements as in
2544 §8.3.2.1, §8.4.2.1, §8.5.2.1 §8.5.6.1, §8.6.2 §8.6.4.1, §8.7.2, §8.8.2, and §8.9.2
2545 or by following the provisions of the Whole Building Performance (WBP)
2546 Method as in §8.2.3.
- 2547 b) ECSBC Plus Buildings shall conform to the mandatory and prescriptive
2548 requirements listed under ECSBC Plus Compliant Building requirements as in
2549 §8.3.3.1, §8.4.3.1, §8.5.3.1 §8.5.6.2, §8.5.7.1, §8.6.3.1, §8.6.4.2 §8.7.3.1,
2550 §8.8.3.1 and §8.9.3.1 or by following the provisions of the Whole Building
2551 Performance (WBP) Method as in §8.2.3.
- 2552 c) ECSBC Super Buildings shall conform to the mandatory and prescriptive
2553 requirements listed under Super ECSBC Compliant Building requirements as
2554 in §8.3.3.2, §8.4.3.2, §8.5.3.2, §8.5.7.2, §8.6.3.2, §8.6.4.3, §8.7.3.2, §8.8.3.2
2555 and §8.9.3.2 or by following the provisions of the Whole Building
2556 Performance (WBP) Method as in §8.2.3.
2557

2558 **8.2 Water Efficiency**

2559 **8.2.1 Water Efficiency Index (WEI):**

2560

2561 Water

2562 Efficiency Index (WEI) is the performance indicator for water efficiency and
2563 refers to the net annual fresh water used per business activity indicator. The
2564 business activity indicator will vary according to the nature of business. It will
2565 be represented either in form of Total Built up area occupied by the business
2566 activity or the total number of occupants using water in the business activity.

2567
$$WEI = \frac{\text{Annual fresh water demand in } m^3}{\text{Business activity indicator}} \quad \text{Eq 8.1}$$

2568

2569 Where:

2570

2571 *The Annual freshwater demand = {Total water demand per day – (reclaimed water*
2572 *per day + recycled water per day + harvested water per day + reused water per day)}*
2573 *X number of working days.*

2574

2575 *Builtup area = Total area – (basement area + parking area*
2576 *+ electromechanical plan areas)*

2577

2578 *Business activity indicator*
2579 *= Total builtup area (OR) Total number of occupants in the business activity*

2580

2581 Note:

2582 a) Actual number of working days in a year shall be considered for arriving at
2583 annual water demand. Working days means actual number of days the
2584 person works in a week excluding Saturday (if 5day week,) Sundays and any
2585 other holidays.

2586 b) WEI value shall be rounded off to two decimal places in accordance with IS 2:
2587 1960 'Rules for rounding off numerical values'.
2588

2589 **8.2.2 Water Efficiency Index Ratio (WEI Ratio):**

2590 Water efficiency ratio is the ratio of the WEI of proposed building to WEI of
2591 the Standard building and shall be calculated as in equation 8.2. WEI ratio shall
2592 be as below,

- 2593 a) ECSBC Compliant building WEI Ratio ≤ 1
2594 b) ECSBC Plus and ECSBC Super WEI ratio < 1
2595

2596 In addition, the building shall conform to mandatory requirements defined in
2597 sub-sections 8.3.2.1, §8.4.2.1, §8.5.2.1 §8.5.6.1, §8.6.2, §8.6.4.1, §8.7.2 §8.8.2
2598 and §8.9.2

2599

2600

2601 $WEI\ Ratio = \frac{WEI\ of\ proposed\ building}{WEI\ of\ standard\ building}$ Eq. 8.2

2602 where

2603 Proposed building is consistent with the actual design of the building and
 2604 complies with all the mandatory requirements of ECSBC.

2605

2606 **8.2.2.1 Prescriptive requirement:**

2607 Building shall use water efficient fixtures, recycled water, reuse of treated used
 2608 water, and rain harvested water.

Table 8.2-1 Maximum Allowed WEI Ratios for Buildings

2609

| Building Type | Business Activity Indicator | ECSBC | ECSBC + | Super ECSBC |
|------------------------|-------------------------------------|-------|---------|-------------|
| Hotel (No Star) | No of Guest nights | 1 | 0.84 | 0.74 |
| Hotel (Star) | No of Guest nights | 1 | 0.80 | 0.70 |
| Resort | No of Guest nights | 1 | 0.80 | 0.70 |
| Hospital | No of Beds | 1 | 0.83 | 0.74 |
| Office (Regular Use) | Total Built up area- m ² | 1 | 0.78 | 0.58 |
| Office (24Hours) | Total Built up area- m ² | 1 | 0.80 | 0.62 |
| Schools and University | Total No of Students | 1 | 0.80 | 0.75 |
| Shopping Mall | Total Built up area- m ² | 1 | 0.82 | 0.68 |

2610

2611

2612 **8.2.3 Whole Building Performance Method (WBP)**

2613 The estimated annual water use for proposed building design shall be less
2614 than standard building design and complies to the mandatory requirements
2615 defined in §8.3 to §8.9. The compliance to prescriptive requirement defined
2616 in §8.3 to §8.9 is not mandatory for buildings conforming to WBP. WBPis

2617

2618 **8.2.4 WEI ratio for Core and Shell Buildings**

2619 WEI for core and shell buildings shall be calculated for the entire building
2620 based on the final design of the wet areas and the relevant mandatory
2621 undertaking(s) for all the users including users of rental premises.

2622

2623 **8.2.5 WEI Ratio for Mixed-use Development**

2624 The WEI ratio for mixed use building shall be as defined in Table 8.2.1. Each
2625 commercial part of a building shall be classified separately to calculate Net
2626 freshwater demand for each sub-classification as per Eq 8.1. The WEI Ratio
2627 of the proposed multipurpose use building shall be calculated based on area-
2628 *weighted average method. To calculate the reference maximum design WEI
2629 Ratio, listed in Table 8.2-1 applicable for the mixed-use building, each
2630 commercial part of mixed-use building shall be classified separately, and,

2631

2632 (a) If a part of the mixed-use building has different classification and is less than
2633 10% of the Total Built-up Area, (excluding basements, parking & electro-
2634 mechanical plant areas), the WEI Ratio of the mixed-use Proposed Building
2635 shall be less than or equal to Maximum Allowed WEI ratio listed in Table 8.2-
2636 1 for the building sub-classification having highest percentage of total built-
2637 up area.

2638

2639 If a part of the mixed-use building has different classification and has more than 10%
2640 of the total built-up area, the WEI ratio of the mixed-use Proposed Building shall be
2641 less than or equal to Maximum Allowed WEI ratio for compliance calculated based

2642 on area weighted average method for all building sub-classifications listed in Table
2643 8.2-1.

2644

2645 *Weighted Average Method is a calculation that takes into account the
2646 varying degrees of importance of the numbers in a data set. In calculating
2647 the weighted average, each number in a data set (say Area) is multiplied by
2648 its weight (WEI Ratio) and then summing these products. The sum of the
2649 products is divided by the sum of the areas to get the weighted average.

2650

2651 **8.2.6 Compliance Documents**

2652 The following documents shall be submitted for compliance check.

2653

- 2654 (a) Flow rate/ volume of water for all Water Efficient plumbing fixtures,
2655 sanitary fittings and appliances.
- 2656 (b) System type, equipment and performance parameters with Process &
2657 Instrumentation (P & I) diagram and reused water quantity for different
2658 application.
- 2659 (c) details of catchment area, run-off co-efficient, intensity of rainfall, rainy
2660 days, storage and reuse for harvested rainwater.
- 2661 (d) type of water metering system and monitoring of water supply from all
2662 sources and consumption.
- 2663 (e) type of technology such as atmospheric water generator, desalination and
2664 any other system with their installed capacity, technical specifications for
2665 alternate sources of water
- 2666 (f) Water Balance chart for water cycle in both dry and wet season on an
2667 annual basis.

2668

2669 **8.2.7 Supplemental Information**

2670 The authority having jurisdiction may require supplemental information
2671 necessary to verify compliance with this code, such as calculations,
2672 worksheets, compliance forms, manufacturer's literature, or other data.

2673

2674

2675 **8.3 Water Quality**

2676 **8.3.1 General**

2677 The building under consideration shall comply with the mandatory and
2678 prescriptive criteria for sources of water and its treatment.

2679 **8.3.2 Mandatory requirement**

2680 **8.3.2.1 ECSBC Building**

- 2681 a) Sources of water shall be as prescribed in Pre-requisites §8.1.2
2682 b) Potable water quality shall comply with the requirements of IS 10500:2012,
2683 Drinking Water – Specification, as given in Tables 1 to 4.
2684 c) Varied recycled applications of treated used water quality such as toilet
2685 flushing, vehicle exterior washing, non-contact impoundments, landscape
2686 irrigation shall comply with the requirements of CPHEEO manual on
2687 Sewerage and Sewage Treatment Systems: 2013, Chapter 7 Table 7.19 issued
2688 by Ministry of Housing and Urban Affairs
2689

2690 Exception to 8.3.4.1(b): Not mandatory if the wastewater generation is less than 10
2691 kld

2692 **8.3.3 Prescriptive requirement**

2693 **8.3.3.1 ECSBC+ Buildings**

- 2694 a) Harvested rainwater: Roof top rainwater to be collected. in storage tank of at
2695 least one day capacity or as per local byelaws whichever is stringent. This
2696 water shall be used after appropriate treatment for potable applications.
2697 b) Reclaimed used water from sewage treatment plants after adequate
2698 treatment can be used for domestic usages other than potable/drinking and
2699 culinary.
2700 c) Condensate water from HVAC systems shall be used for various applications
2701 like domestic use (wash basins, shower & Pantry) flushing, landscaping, car
2702 wash, floor wash & swimming pool make-up water
2703 d) Segregation and separate treatment to be offered for grey and black water
2704 for achieving the desired water quality for varied reuse applications.

2705

2706 **8.3.3.2 Super ECSBC Buildings**

2707 Grey water to be segregated and treated separately and reused for potable
2708 drinking purposes.

2709 **8.4 Water Treatment**

2710 **8.4.1 General**

2711 All types of water treatment systems shall comply with the mandatory provisions of
2712 §8.4.2 and the prescriptive criteria of §8.4.3 for the respective water and energy
2713 efficiency levels.

2714 **8.4.2 Mandatory requirements**

2715

2716 **8.4.2.1 ECSBC Buildings**

2717 (a) Representative samples of water from all sources shall be drawn, for
2718 laboratory testing of water quality as prescribed in IS 1622 and IS 3025.
2719 Samples shall be taken before installation of water treatment plant to
2720 establish design basis as well as every day based on operating period of water
2721 treatment plant to ensure consistency in water quality.

2722 (b) Water Treatment shall be carried out as per guidelines by CPHEEO Manual on
2723 Water Supply and Treatment, May1999 to meet water quality for various
2724 applications as specified in §8.3.4.1. (b)

2725 (c) Based on water test reports if TDS levels exceed quality given by IS 10500:
2726 2012, Reverse Osmosis (RO) treatment is required and the minimum recovery
2727 rate shall be 65%.

2728

2729 **8.4.3 Prescriptive requirements**

2730

2731 8.4.3.1 ECSBC + Buildings based water quality monitoring system covering basic
2732 parameters like flow, pH, TSS, and TDS shall be provided. These
2733 parameters shall be monitored after treatment.

2734 Based on water test reports if TDS levels exceed quality given by IS 10500:
2735 2012 and Reverse Osmosis if is required, minimum rate of recovery shall
2736 be 75%

2737 **8.4.3.2 ECSBC Super Buildings**

2738 (a) Based on water test reports, if TDS levels exceed quality given by IS 10500:
2739 2012 and Reverse Osmosis treatment is required, minimum rate of recovery
2740 shall be 85% which can be achieved by multiple stage treatment.

2741 (b) Reject water from RO filtration plants to be treated to reduce TDS level to
2742 2100mg/l, as per Guidelines for Utilisation of Treated effluent in irrigation by
2743 CPCB. The treated effluent shall meet the norms prescribed for irrigation
2744 under Environment Protection Rules, 1986.

2745 (c) R. O. reject water shall be reused after treatment or disposed off by
 2746 authorized agencies where the Total Dissolved solids (TDS) content is more
 2747 than 2100 mg/l.
 2748

2749 **8.5 Pumping System, Water Distribution and Metering**
 2750

2751 **8.5.1 Pumping Systems**

2752 Water transfer pumps for domestic, wastewater and reclaimed water shall
 2753 comply with energy efficiency values as defined in Table 8.5.1, Table 8.5.2
 2754 and Table 8.5.3.

2755 **8.5.2 Mandatory requirements**

2756 **8.5.2.1 ECSBC Buildings**

- 2757 a) All pups shall be Selected with flow-head characteristics between 70% to
- 2758 110% of flow at BEP (Best efficiency point) of the curve.
- 2759 b) All non-submersible pumps shall be coupled with IE 3 and higher
- 2760 efficiency class motors
- 2761 c) All submersible pumps shall be coupled with IE 2 and above efficiency
- 2762 class motors.
- 2763 d) Pumps for other applications shall have minimum overall efficiency as per
- 2764 Table 8.5.1.
- 2765

2766 Table 8.5.1 Overall Efficiency of pump and motor Requirements for ECSBC Building

| Equipment | Minimum Overall Efficiency (%) |
|---|--------------------------------|
| a) Domestic water pumps | 60 |
| b) Flushing water pumps | 60 |
| c) Surface water pumps | 60 |
| d) Wastewater pumps (Solids – 10 to 20 mm size) | 45 |
| e) Sewage pumps (Solids – 40 to 50 mm size) | 45 |
| f) Hot Water circulation pumps | 45 |

2767

2768 **8.5.3 Prescriptive requirements**

2769

2770 **8.5.3.1 ECSBC + Buildings**

- 2771 a) All pumps shall comply with mandatory requirements defined in §8.5.2
- 2772 b) All non-submersible pumps shall be coupled with minimum IE 3 and above
- 2773 efficiency class motors.
- 2774 c) Pumps for other applications shall have minimum overall efficiency as per Table
- 2775 8.5.2.
- 2776

Table 8.5.2 Pump Overall Efficiency Requirements for ECSBC Plus Building

| Equipment | Minimum Overall Efficiency (%) |
|---|--------------------------------|
| a) Domestic water pumps | 65 |
| b) Flushing water pumps | 65 |
| c) Surface water pumps | 65 |
| d) Wastewater pumps (Solids – 10 to 20 mm size) | 50 |
| e) Sewage pumps (Solids – 40 to 50 mm size) | 50 |
| f) Hot Water circulation pumps | 50 |

2777

2778 **8.5.3.2 For Super ECSBC Buildings**

- 2779 a) All pumps shall be conform to §8.5.2 and §8.5.3
- 2780 b) All non-submersible pumps shall be coupled with minimum IE 4 efficiency
- 2781 class motors or higher..
- 2782 c) Pumps for other applications shall have minimum combined efficiency as per
- 2783 Table 8.5.3.

Table 8.5.3 Pump Efficiency Requirements for Super ECSBC Building

| Equipment | Minimum Overall Efficiency (%) |
|---|--------------------------------|
| a) Domestic water pumps | 70 |
| b) Flushing water pumps | 70 |
| c) Surface water pumps | 70 |
| d) Wastewater pumps (Solids – 10 to 20 mm size) | 55 |
| e) Sewage pumps (Solids – 40 to 50 mm size) | 55 |
| f) Hot Water circulation pumps | 50 |

2784

2785 **8.5.4 Piping Systems**

2786 Piping systems shall comply with the mandatory requirements of §8.5.4.1

2787 **8.5.4.1 Mandatory requirement**

2788 a) Piping systems shall comply with guidelines of NBC 2016 (Part 9, Section 1:
2789 Water Supply)

2790 b) Hot water piping shall be provided with required insulation as per section 8.6.
2791 Table 8.6.3-1

2792

2793 **8.5.5 Metering**

2794 Management of water resources in a system is a function of the measurement of
2795 quantity of water at source and its effective usage. Metering facilitates users to
2796 generate data and charts to monitor water usage regularly and to fix leaks and
2797 wastages so as to minimise water wastage.

2798 All measurement of flow of water shall be carried out by using either positive
2799 displacement type meters, velocity type meters, multi jet meters shall conform to IS
2800 779. Electromagnetic meter, Ultrasonic and IOT smart meters are also used.

2801

2802 Water meters shall be installed on all types of water feed lines entering the building
2803 premises on the inflow side and on all outflow lines supplying water to the building
2804 as per §8.7.1.1(d) and §8.7.2.1(d).

2805

2806 **8.5.6 Controls**

2807

2808 **8.5.6.1 Mandatory Requirement for ECSBC Buildings**

- 2809 a) All storage sumps/tanks shall be provided with float switch level controller for
2810 pumping system.
- 2811 b) Hydro-pneumatic systems, if used, shall be provided with pressure switch to
2812 maintain consistent pressure both at suction and delivery manifolds.
- 2813 c) Auto change overs are recommended for all the pumping systems when working
2814 and stand by pumps are installed as per emergency and any exigencies.
- 2815 d) Mechanical Flow meters shall be provided on all water supply lines supplying
2816 various types of water of varied water quality and quality of water depending on
2817 the applications.
- 2818

2819 **8.5.6.2 Prescriptive Requirement**

2820

2821 For ECSBC+ Buildings

2822

- 2823 a) All storage sumps/tanks shall be provided with solenoid-based level controller
2824 with auto ON / OFF for pumping system to avoid overflow and wastages.
- 2825 b) Hydro-pneumatic systems, if used, shall be provided with pressure
2826 transmitters to maintain consistent pressure both at suction and delivery
2827 manifolds to make sure dry running shall be avoided at suction side, to
2828 maintain and monitor the pressures on delivery side.
- 2829 c) IoT based flow meters shall be provided on all water supply lines.
- 2830 d) All pumping systems shall be controlled through PLC based system connected
2831 to BMS and data should be transmitted for remote management.
- 2832

2833 For Super ECSBC Buildings

2834

- 2835 a) All storage sumps/tanks shall be provided with Infra-Red level indicator,
2836 controller with auto ON / OFF and alarm for pumping system.
2837 b) All pumping systems shall be controlled through PLC based system connected
2838 to BMS and data shall be transmitted for remote management.
2839

2840 **8.6 Service Water Heating**

2841 **8.6.1 General**

2842 Service Water Heating and equipment's shall comply with the Mandatory
2843 requirements and the Prescriptive criteria, as per §8.6.2 and §8.6.3 respectively.

2844

2845 **8.6.2 Mandatory Requirements**

2846 8.6.2.1 ECSBC buildings shall have Centralised Hot Water Systems for Buildings,
2847 covered under this code in all climatic zones, shall have heat pump based
2848 water heating meeting following requirements.
2849

- 2850 (a) Air source heat pumps shall meet or exceed minimum COP of 3.5.
2851 (b) Water Source Heat Pumps shall meet or exceed minimum COP of 4.5
2852 (c) Ground Source Heat Pumps shall meet or exceed minimum COP of 3.0
2853

2854 Exception to § 8.6.2.1:

- 2855 (a) Hospitality and Healthcare in all climatic zones shall have solar water heating
2856 equipment installed to provide at least 40% of the total hot water design
2857 requirement, balance 60% requirement shall be met with High Energy Efficient
2858 System.
2859 (b) Systems that use heat recovery (Condenser recovery from Chillers) to provide
2860 the hot water capacity required as per the building type and size.
2861 (c) Buildings that install Solar PV cells of capacity 5% of Total Contractual Power
2862 Demand or 200 W/Sqm whichever is less.
2863

2864 8.6.2.2 Other Water Heating System - Supplementary heating system shall be
2865 designed to maximize the energy efficiency of the system and shall
2866 incorporate the following design features in cascade:

- 2867 (a) Maximum heat recovery from hot discharge system like condensers of
2868 air conditioning units.
2869 (b) Use of gas fired heaters wherever gas is available, and
2870 (c) Electric coil heaters

- 2871 8.6.2.3 Heating Equipment Efficiency of Service water heating equipment shall
2872 comply or exceed the performance and minimum efficiency requirements
2873 presented in relevant Indian Standards;
- 2874 (a) Solar water heater shall comply with the performance/ minimum
2875 efficiency level as mentioned in IS 13129 Part (1&2) IS 16368
- 2876 (b) Gas Instantaneous water heaters shall comply with the
2877 performance/minimum efficiency level as mentioned in IS 15558 with
2878 above 80% Fuel utilization efficiency.
- 2879 (c) Electric water heater shall comply with the performance/ minimum
2880 efficiency level as mentioned in IS 2082 and shall be BEE star labelled.
- 2881 (d) Electric coil heaters shall comply with IS 4149: 2021.
- 2882 (e) For evacuated tube collector, the storage tanks shall comply with IS
2883 16542, tubes shall comply with IS 16543 and IS 16544 for the complete
2884 system.
2885
- 2886 8.6.2.4 Return Re-circulation Line: In case of centralised system, a return Line from
2887 the end of Supply line, shall be installed to avoid Water Loss, with an
2888 Automated Pumping System with temperature & timer Controls.
2889
- 2890 8.6.2.5 Piping Insulation for Supply & Return Lines – Piping for heating, space
2891 conditioning, and service hot water systems shall meet the insulation
2892 requirements listed in Table 8.6.3-1 through Table 8.6.3-3. Insulation
2893 exposed to weather shall be protected by aluminium foil. Cellular foam
2894 insulation shall be protected as above or be painted with water resistant
2895 paint.
2896
- 2897 Exceptions to §8.6.2.5:
- 2898 (a) Reduction in insulation R value by 0.2 (compared to values in Table 8.6.3-1,
2899 Table 8.6.3-2 and Table 8.6.3-3) to a minimum insulation level of R-0.4 shall be
2900 permitted for any pipe located in partition within a conditioned space or laid
2901 underground. Insulation R value shall be increased by 0.2 over and above the
2902 requirement in Table 8.6.3-1 for any pipe located in a partition outside a
2903 building with direct exposure to weather.
2904
- 2905 Table 8.6.3-1 Insulation Requirements for Pipes in ECSBC Building Insulation R Value
2906 ($m^2.K/W$)

| Operating Temperature | Pipe Size - < 40mm | Pipe Size ≥40mm |
|---------------------------|--------------------|--------------------|
| >60 Deg. C and ≤94 Deg. C | 0.7 | 0.7 |
| >40 Deg. C and ≤60 Deg. C | 0.4 | 0.7 |

2907

2908 Exception to Table 8.6.3-1

2909 In case for Insulation if 'R' values as per Table 8.6.3-1 is not used the exception will
2910 be to use insulation material which will improve the performance by 85%.

2911 8.6.2.5 Hot Water Tank Temperature to be maintained as per NBC 2016, Part 9,
2912 Clause 4.14.2.2
2913

2914 **8.6.3 Prescriptive Requirements**

2915

2916 **8.6.3.1 ECSBC + Buildings**

2917 Hospitality and Healthcare in all climatic zones shall have solar water
2918 heating equipment installed to provide at least 60% of the total hot
2919 water design requirement and balance 40% to be augmented by any
2920 other Hot Water generating systems.

2921 Exception to §8.6.3.1

2922 Buildings that install Solar PV cells of capacity 7.5% of Total Contractual Power
2923 Demand or 300 W/ m² whichever is less.

2924 **Table 8.6.3-2:** Insulation Requirements for Pipes in ECSBC Plus Building – Insulation
2925 R Value (m².K/W)

| Operating Temperature | Pipe Size ≤ 40mm | Pipe Size ≥40mm |
|---------------------------|---------------------|-----------------|
| >60 Deg. C and ≤94 Deg. C | 0.8 | 0.8 |
| >40 Deg. C and ≤60 Deg. C | 0.5 | 0.9 |

2926 Exception to Table 8.6.3-2

2927 In case for Insulation if 'R' values as per Table 8.6.3-2 is not used the exception will
2928 be to use insulation material which will improve the performance by 90%.

2929 **8.6.3.2 Super ECSBC Buildings**

2930

2931 Hospitality and Healthcare in all climatic zones shall have solar water heating
2932 equipment installed to provide 00% of the total hot water design requirement.

2933

2934 Exception: Buildings that install Solar PV cells of capacity 10% of Total Contractual
2935 Power Demand or 400 W/ Sq. M whichever is less.

2936

2937 Table 8.6.3-3 Insulation Requirements for Pipes in Super ECSBC Building – Insulation
2938 R Value (m².K/W)

2939

| Operating Temperature | Pipe Size ≤ 40mm | Pipe Size ≥40mm |
|----------------------------|---------------------|-----------------|
| >60 Deg. C and ≤ 94 Deg. C | 1.0 | 1.3 |
| >40 Deg. C and ≤ 60 Deg. C | 0.7 | 1.1 |

2940 Exception to Table 8.6.3-3

2941 In case for Insulation if 'R' values as per Table 8.6.3-3 is not used the exception will
2942 be to use insulation material which will improve the performance by 92%.

2943

2944 **8.6.4 Water Heating Controls & Safety**

2945

2946 **8.6.4.1 For ECSBC Buildings**

2947 (a) Gas Heaters: It is important to have an exhaust system properly installed to
2948 take out CO (Carbon Monoxide) which gets generated due to Gas burning and
2949 thermostat to control the water temperature.

- 2950 (b) Heat Pumps: Controls shall be provided for the Heat Pump as follows:
2951 1. Control for High / Low pressure Cut Off for Refrigerant Gas.
2952 2. Control for Temperature Cut Off & Re Start – With provision of differential
2953 temperature setting.
2954 3. Control for Chilled / Cooling Water Temperature Cut Off (In case of Water
2955 Source Heat Pumps)
- 2956 (c) Solar Systems: In an active solar water heating system, control systems are
2957 used to switch on a circulation pump whenever energy gain is possible through
2958 solar collectors. Otherwise, it automatically switches off the pump. A
2959 differential thermostat is recommended as it optimizes the energy gain for the
2960 system. Use of Thermostatic Mixing Valves to avoid High Temperature water
2961 going out from Solar Panels.

2962

2963 **8.6.4.2 For ECSBC + Buildings**

2964 Heat pumps shall have PLC Based system panel, to give data to Central
2965 BMS of the building.

2966

2967 **8.6.4.3 For Super ECSBC Buildings**

2968 Heat pumps shall have IOT based system, to have online data available to
2969 various concerned parties.

2970

2971 **8.6.5 Swimming Pool Heating**

2972 All heated pools shall be provided with a vapour retardant pool cover on
2973 the water surface. Pools heated to more than 32°C shall have a pool
2974 cover with a minimum insulation value of R-4.1.

2975

2976 Refer Table 8.6.5-1 Energy consumption calculations. For various Hot water
2977 systems.

2978

2979 Table 8.6.5 – 1 Energy consumption calculation for various hot water system

2980 Sample calculation to workout kW/litre/year

| Type of Hot Water System | Consumption | Consumption per litre | Consumption per litre / Year |
|--|-------------|-----------------------|------------------------------|
| | kW | kW/ litre | kW/litre/ year (365 Days) |
| Electrical water heater | 654 | 0.065 | 23.87 |
| Diesel / Gas boilers (90% efficiency) | 581 | 0.06 | 21.22 |
| Solar water heating with electrical backup (90 non solar days) | 654 | 0.065 | 5.89 |
| Air source heat pumps (with minimum 3.5 COP) | 149.5 | 0.015 | 5.46 |
| Water source heat pump (with minimum COP 5.0) | 104.65 | 0.01 | 3.82 |
| Air source heat pumps with Solar - hybrid system (90 non solar days) | 149.5 | 0.015 | 1.35 |
| Water source heat pumps with Solar - hybrid system (90 non solar days) | 104.65 | 0.01 | 0.94 |

2981

2982 Sample calculation calculate power consumption per liter per year for hot water
 2983 requirement of 10000 liters per day is given below.

2984

2985 Hot water requirement = 10000 liters per day

2986 Ambient temperature = 15°C

2987 Hot water temperature = 60°C

2988 Heat load 'Q': ($Q = m \times C_p \times \Delta T$) = 450000

2989 **8.7 Water Balance:**
2990

2991 **8.7.1 General**
2992

2993 The purpose of Water Balance is to give information on the total water inflow and
2994 outflow within the property or facility through a pictorial diagram. It is a tool which
2995 aids in conserving the water, controlling wastage and predict water shortfall.

2996 The water balance shall be made for both 'Dry Season' and 'Wet Season' conditions.

2997 (Dry season can be considered as period of low rainfall. This can be taken as 4 months
2998 from June to September. Wet season can be considered as period of prolonged
2999 rainfall. This can be taken as 8 months from October to May.)

3000 Exception: In areas where the rainfall pattern is spread over a wider prolonged
3001 period, the period of dry season and wet season can be as per the actual seasonal
3002 rainfall recorded. This will be supported by documented evidence from the
3003 Meteorological department.

3004

3005 **8.7.2 Water Balancing**
3006

3007 **8.7.2.1 Mandatory Requirements**

3008 The buildings shall conform to the following –

3009

3010 (a) The population of the building shall be calculated as per Clause 4.1.b Section-1
3011 Part 9 in NBC 2016. For building typologies which are not covered in NBC 2016,
3012 the actual occupancy for which the building is designed by Architect or
3013 equivalent competent authority along with the design basis for the derived
3014 population estimates shall be submitted.

3015 (b) Minimum water requirements for buildings and facilities shall be as given in the
3016 Table-1 of Clause 4.1.2 of NBC 2016: Part 9, Section-1: Water supply.

3017 (c) The total water supply fixture units for different fixtures shall be as given in the
3018 Table 2 of Clause 4.7.3.1 of NBC 2016 Part 9, Section-1: Water Supply. Based on
3019 these fixture units the Probable Simultaneous Demand is calculated as per
3020 Table 3 Clause 4.7.3.2 of NBC 2016 Part 9 Section-1: Water Supply.

3021 (d) Water Efficiency: The fixtures and sanitaryware shall follow the Star rating as
 3022 per Table 1 and Table 4, IS 17650 Part 1 and Part 2. An Extract of the table is
 3023 given below for ready reference. The star rating to be followed for ECSBC,
 3024 ECSBC+ & Super ECSBC will be as given in the relevant sections below.

3025

3026 Table – 8.7.2-1: Water Efficiency Rating Criteria for Sanitaryware

| Sl. No | Unit | Water Consumption Unit | ECSBC | ECSBC + | Super ECSBC |
|--------|--------------|------------------------|-------|---------|-------------|
| 1 | Water closet | lpf full flush | ≤6.0 | ≤4.8 | ≤4.0 |
| | | lpf reduced flush | ≤3.0 | ≤2.8 | ≤2.0 |
| 2 | Urinal | Lpf | ≤3.0 | ≤2.0 | ≤1.0 |

3027 Note: lpf - Litres per flush.

3028

3029 Table – 8.7.2-2: Water Efficiency Rating Criteria for Sanitary Fitting

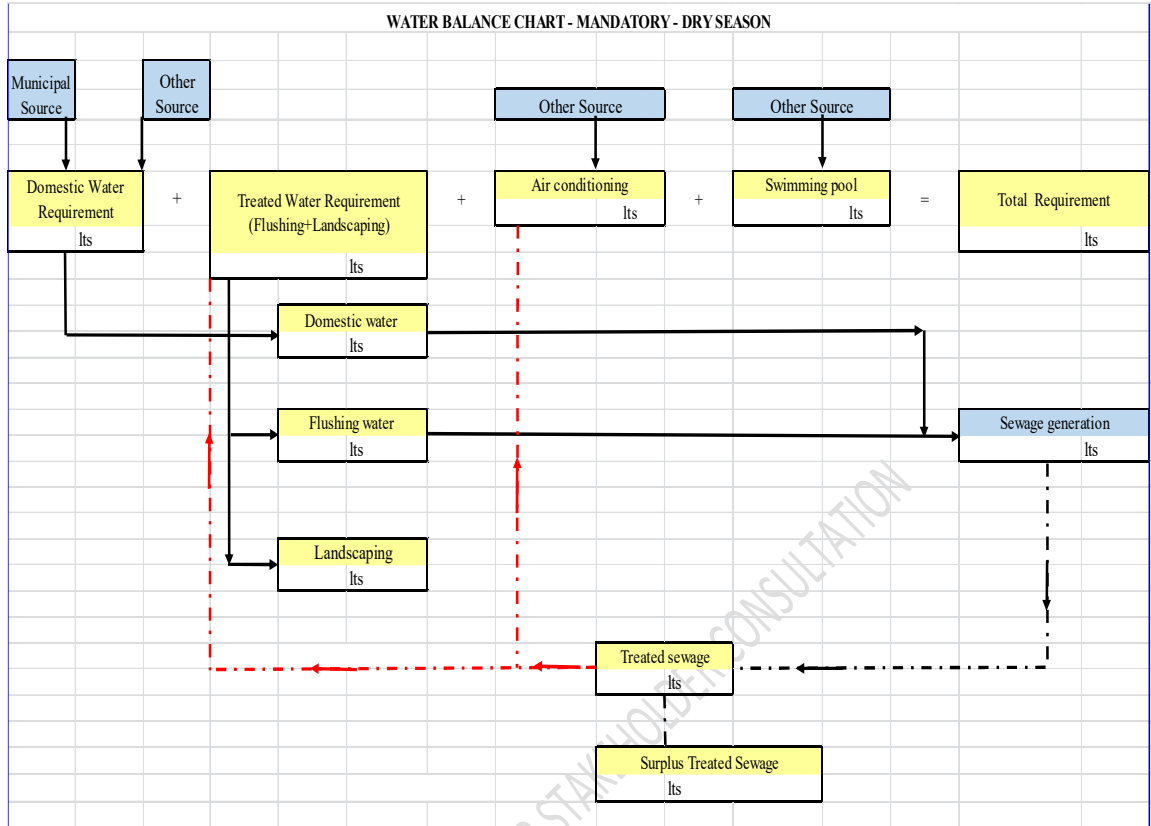

| Sl. | Unit | Unit | ECSBC | ECSBC + | Super ECSBC |
|-----|--------------------------|------------|-------|---------|-------------|
| 1 | Washbasin Metered Faucet | Litres/use | ≤1.0 | ≤0.8 | ≤0.6 |
| 2 | Urinal Metered Faucet | lpf | ≤3.0 | ≤2.0 | ≤1.0 |
| 3 | Washbasin tap | Lpm | ≤8.0 | ≤6.0 | ≤3.0 |
| 4 | Sink Faucet | Lpm | ≤8.0 | ≤6.0 | ≤4.5 |
| 5 | Overhead Shower | Lpm | ≤10.0 | ≤8.0 | ≤6.8 |
| 6 | Handheld Shower | Lpm | ≤8.0 | ≤6.0 | ≤4.0 |
| 7 | Handheld Ablution Spray | Lpm | ≤6.0 | ≤5.0 | ≤4.0 |

3030 Note: The flow rates are at maximum pressure of 4.2 kg/cm²

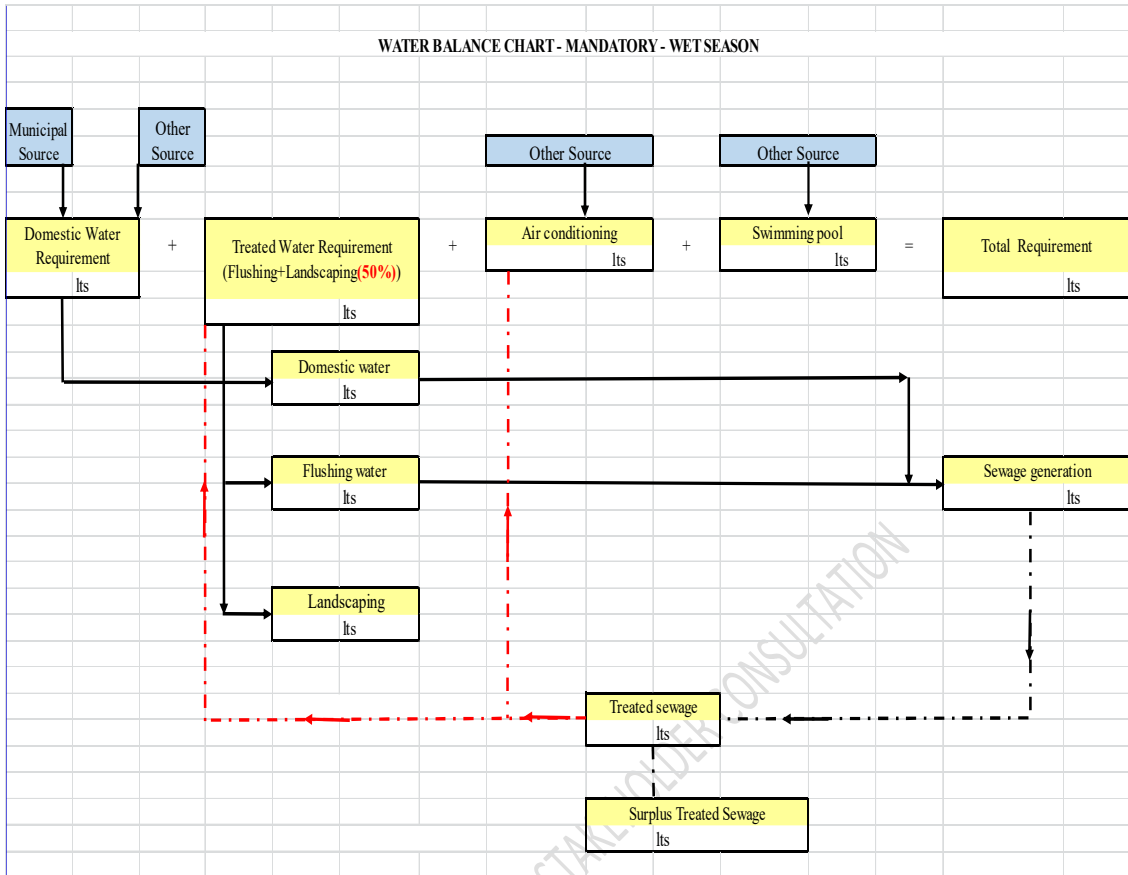

- 3031 **8.7.3 Water Efficiency for ECSBC Buildings**
- 3032 a) The fixtures and sanitary ware should follow **1** star rating as per Table
- 3033 1and Table 4, IS 17650 Part 1 and Part 2.
- 3034 b) Treated recycled sewage will be used for, flushing, landscaping,
- 3035 cooling tower make-up.
- 3036 c) Rainwater harvesting to be done in the form of rain water
- 3037 storage/recharge pits.
- 3038 d) Analogy type water meters for supply line, flushing, landscaping,
- 3039 cooling tower make-up, inflow to and outflow from the STP and
- 3040 harvested rainwater.
- 3041

DRAFT FOR STAKEHOLDER CONSULTATION

3042

3043

3044

3045

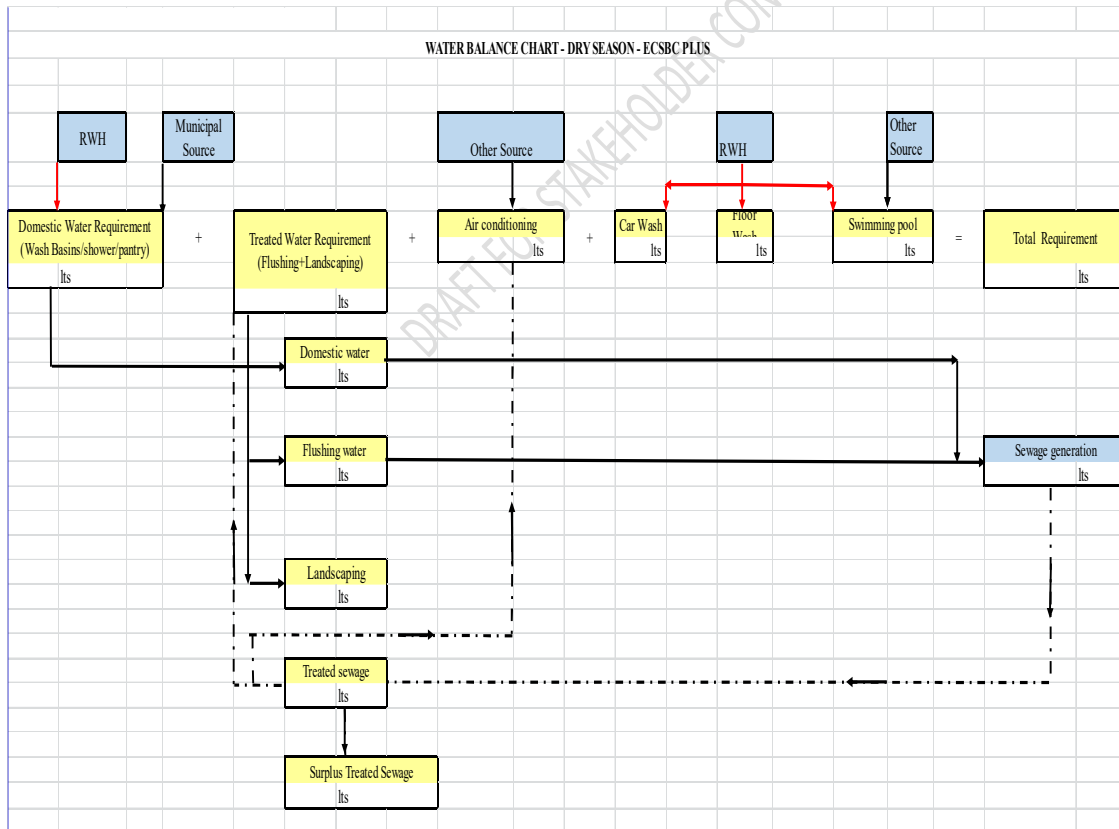

3046 8.7.3 Prescriptive Requirements

3047 Prescriptive buildings shall be defined as buildings which shall result in more
3048 water conservation than ECSBC mandated buildings. The requirements of
3049 Prescriptive buildings shall conform to all the requirements of Mandatory
3050 Buildings.

3051

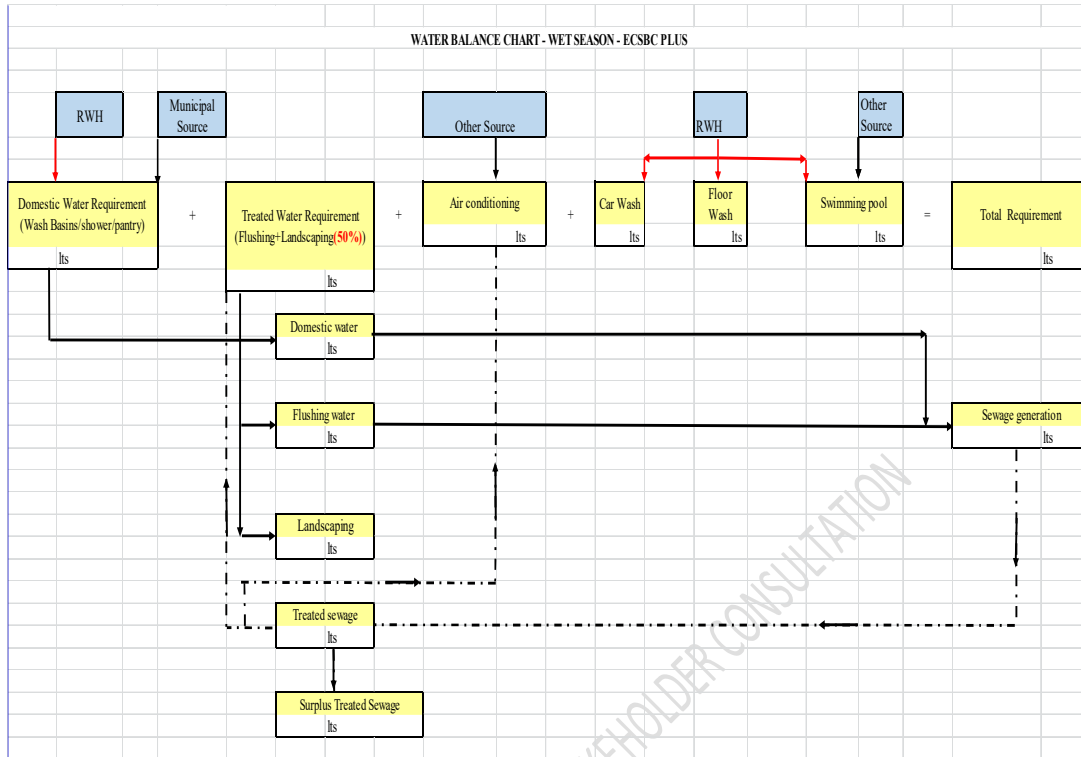

3052 8.7.3.1 Water Efficiency for ECSBC+ Buildings:

- 3053 (a) The fixtures and sanitary ware shall follow 2 star rating as per Table 1 and
3054 Table 4, IS 17650 Part 1 and Part 2.
3055 (b) Reuse/Recycle of condensate water produced from air conditioning system.
3056 (c) Rainwater harvesting water to be utilized for domestic (wash basins,
3057 shower, pantry), car wash, floor wash and swimming pool makeup water
3058 (d) IOT based Smart water meter for all types of water as in §8.7.2(h)
3059

3060

3061

3062

3063

3064 8.7.3.2 Water Efficiency for ECSBC Super Buildings:

3065

a) The fixtures and sanitary ware shall follow **3** star rating as per Table 1 and Table 4, IS 17650 Part 1 and Part 2.

3066

3067

b) The treated recycled sewage will be used for domestic, drinking and swimming pool

3068

3069

c) Sea water to be used for domestic consumption by means of desalination plant, if no other alternative source is available.

3070

3071

d) .

3072

e) Reject water from RO filtration plants to be treated to acceptable standards before disposal as per §8.4.3.2(b)

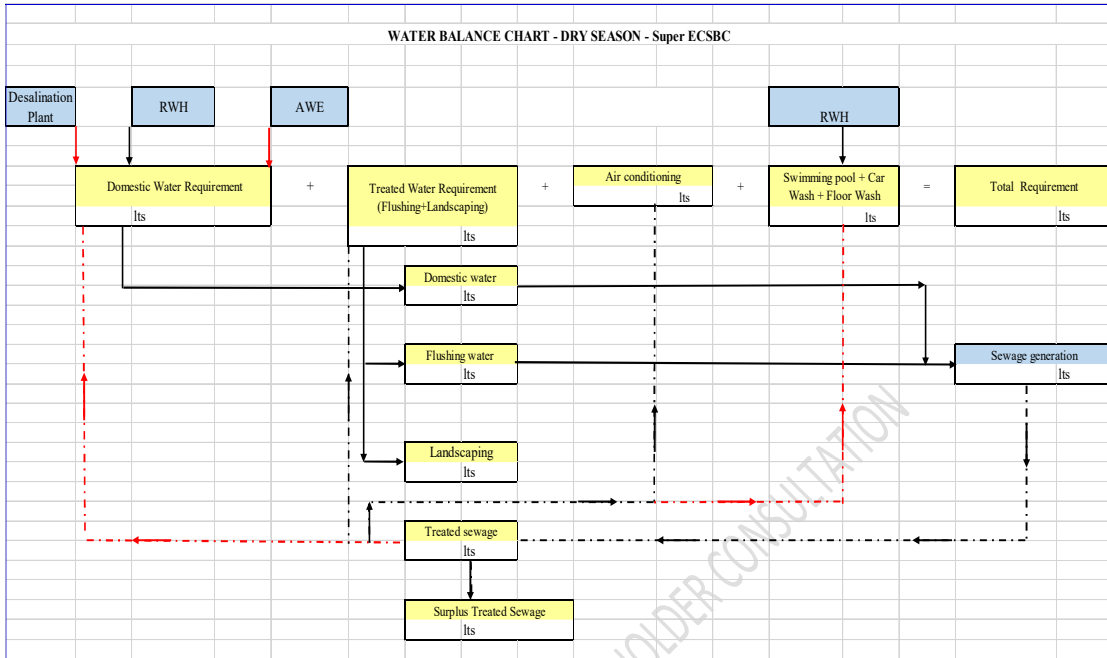

3073

3074

f) Water metering as per §8.7.3.1(d)

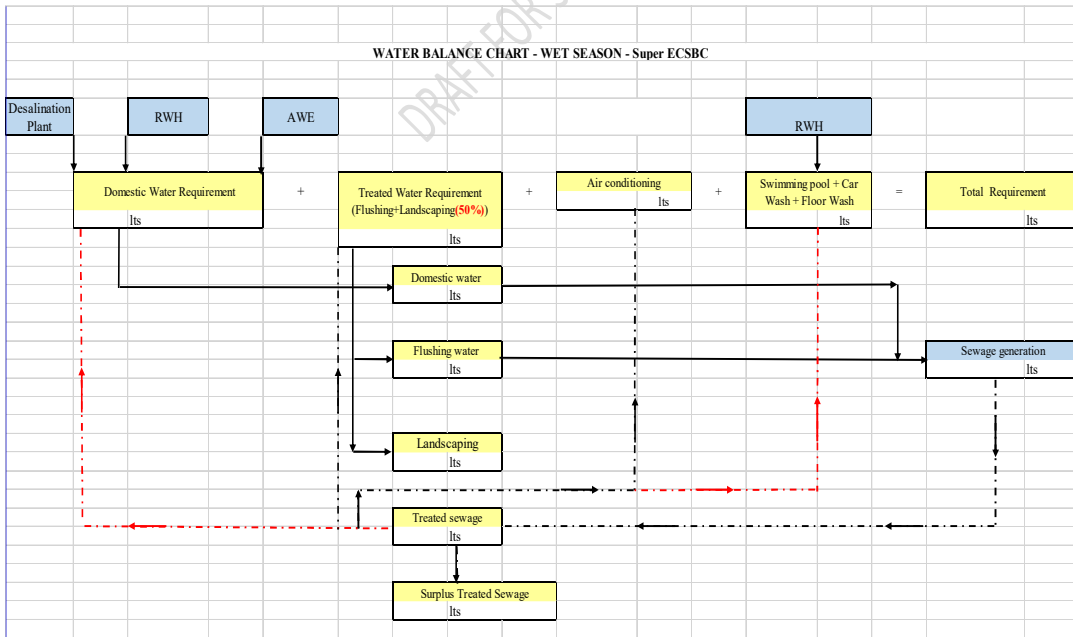

3075

3076

3077

3078

3079

3080 **8.8 Wastewater Treatment and Reclamation**

3081 **8.8.1 General**

3082 One of the approaches for raw water reduction in building premises is to
3083 recycle the water by installing on-site Wastewater Treatment Plant. Treated
3084 water can be reused for applications such as flushing, landscaping, water
3085 bodies, cooling tower make-up, cleaning, etc.

3086 Wastewater Treatment is a process of removing contaminants from
3087 wastewater. Its objective is to produce an environmentally safe fluid waste
3088 stream. Tertiary and/or Polishing treatment such as dual media filter,
3089 activated carbon filter, disinfection system shall be provided so that the
3090 treated water characteristics as per Pollution Control Board (PCB) norms are
3091 achieved.

3092 Further enhanced treated water quality shall be achieved with advanced
3093 treatments like Softener, Membrane filtration system to achieve required
3094 quality for reuse.

3095 **8.8.2 Mandatory requirements**

3096 ECSBC Building

3097 (a) Wastewater treatment plant of capacity capable of treating 100%
3098 wastewater shall be installed with the requirements as specified in the
3099 CPHEEO Manual on Sewerage and Sewage Treatment System, National
3100 Building Code 2016 (Part 9: Plumbing Services, Section 2: Drainage and
3101 Sanitation, Subsection 4.13: Sewage Treatment Systems) and shall meet
3102 treated waste water quality as specified under Environmental
3103 (Protection) Rules, 1989 and amendments thereof.

3104 (b) IoT based flowmeter shall be provided each at the inlet and outlet of the
3105 sewage treatment plant.

3106 (c) IoT based online water quality monitoring system covering the basic
3107 parameters like pH, TSS, BOD, COD and TDS shall be provided at the
3108 outlet of the sewage treatment plant.

3109 (d) Sewage treatment plant shall meet treated wastewater quality for reuse
3110 in various applications as specified in CPHEEO Manual on Sewerage and
3111 Sewage treatment systems: 2013, Chapter 7, Table 7.19. Reuse treated
3112 sewage shall be used for landscaping, flushing, and cooling tower make-
3113 up water (If water cooled chillers are installed).

3114 (e) STP and pump room installed in basement shall be provided with
3115 adequate ventilation as per National Building Code 2016 (Part 8: Building
3116 Services, Section 11, Clause 11.3, Table 11).

3117

3118 **8.8.3 Prescriptive requirements**

3119 8.8.3.1 ECSBC + Building

3120 (a) Separate Grey water and Black water treatment shall be provided.

3121 (b) Adequately treated Grey water shall be reused for all potable purposes
3122 excluding drinking and culinary along with HVAC cooling tower make – up
3123 (If water cooled chillers are installed)

3124 (c) Treated Black water shall be reused for flushing and landscape irrigation. In
3125 case of deficit, treated grey water shall be used to augment the demand.

3126 8.8.3.2 Super ECSBC Building

3127 (a) All ECSBC + prescriptive requirement to be followed as mandatory
3128 requirement.

3129 (b) Grey water shall be treated to comply with IS 10500: 2012 drinking water
3130 standards and reused for non-potable purposes and HVAC cooling tower
3131 make-up if water cooled chillers are installed.

3132

3133 **8.9 Rainwater Harvesting and Reuse**

3134

3135 **8.9.1 General**

3136 Rainwater harvesting is the direct collection and storage of rainwater, rather than
3137 allowing it to run off. Rainwater is collected from building roof top and paved surfaces
3138 redirected to a tank, recharge to shallow aquifer, or a reservoir with percolation, so
3139 that it infiltrates into the ground.

3140

3141 Rainwater harvesting shall comply with the mandatory provisions of §8.19.2 and the
3142 prescriptive criteria of §8.9.3.

3143

3144 **8.9.2 Mandatory requirements:**

3145 For ECSBC compliant Buildings, Rainwater harvesting shall comply with rainwater
3146 harvesting and water conservation manual 2019 by CPWD, CPHEEO manual and local
3147 bye laws, whichever is stringent shall be followed.

3148 **8.9.3 Prescriptive Requirements:**

3149

3150 8.9.3.1 ECSBC + Building

3151 a. Entire roof top water storage shall be harvested with appropriate
3152 treatment and reuse for potable applications.

3153 b. Recharge percolation pits as per soil suitability to be adopted.

3154

3155 8.9.3.2 SuperSECSBC Building

3156 Compliance shall be demonstrated with full utilisation of annual
3157 potential of harvested rainwater such that there is zero dependency of
3158 fresh water.

3159 **Table: 8.9.4-1 Calculation of quantity of water to be Harvested**

3160 The total amount of water that is received in the form of rainfall over an area is
3161 called the rainwater endowment of that area. The rainwater that can be effectively
3162 harvested out of this amount is called the “Rainwater Harvesting Potential”

3163

3164

DRAFT FOR STAKEHOLDER CONSULTATION

| | |
|--|--|
| Annual rainfall of any city | 900 mm |
| Height of rainfall | 0.9m |
| Area of Roof | 1000 m ² |
| Catchment volume (A) | 900 m ³ (900000 litres) |
| Calculation for Effectively harvested water from total rainfall | |
| Run off co-efficient for roof surface | 0.85 |
| Co-efficient for evaporation, spillage and first flush wastage | 0.8 |
| Effectively harvested water quantity | Rainwater endowment (A) x 0.8 x Run off co-efficient |
| | = 900000 x 0.8 x 0.85 |
| | = 6,12,000 litres |
| Calculations for water requirements for a typical office building | |
| Total occupants | 500 person |
| Per capita consumption | 45 litres/p/day |
| Drinking water per person/day | 10 litres/p/d |
| working days | 240 days |
| shift | 1 |
| No of persons | 500 (assumed) |
| Total Annual drinking water requirement | 500 x 10 x 240 = 1200000 litres/year |

Total Rainwater harvested = 6,12,000 litres

Total drinking water requirement = 12,00,000 litres

Thus over 50% of the annual drinking water can be serviced with Rainwater from Rooftop.

Section 9

WASTE MANAGEMENT

DRAFT FOR STAKEHOLDER CONSULTATION

3171

9. Waste Management

3172

9.1 General Requirement

3173

3174

3175

3176

Waste management is applicable to all building typologies during construction, operation, and maintenance phases of the building project. All types of waste including solid, liquid, and gaseous waste are covered. Site area of the project is the boundary condition for managing all three types of waste.

3177

3178

3179

3180

3181

3182

3183

3184

3185

3186

3187

3188

3189

- i. Solid waste –solid waste being sent to landfill during construction, operation, and maintenance.
- ii. Liquid waste –liquid waste other than wastewater. Refer Chapter 8 for wastewater management requirements. However, the local regulatory requirements shall apply in addition.
- iii. Gaseous waste – gaseous waste examples as specified in table 9.2 to 9.5. However, the local regulatory requirements shall apply in addition.

A building project under construction phase complying to the code need to demonstrate meeting the requirements of all three types of waste management from the beginning of the construction to ready to occupy stage. If there is a need for demolition of an existing structure in the project site, the demolition waste needs to be addressed as per the requirements specified for waste management during construction phase.

3190

3191

3192

A building complying to the ECSBC code shall meet all the three mandatory requirements. The number of prescriptive requirement shall be as defined in table below.

| No of Prescriptive Measures Implemented | Compliance Level |
|---|------------------|
| 4 | ECSBC |
| 7 | ECSBC + |
| 9 | Super ECSBC |

3193

9.2 Mandatory requirements

3194

3195

3196

9.2.1 Designated space for waste collection and Storage
The building project shall allocate a dedicated area for collecting and storing construction waste (solid waste) generated throughout the construction phase and

3197 post occupancy. For the construction phase, the designated space should be located
3198 on-site or adjacent to the project site within a maximum distance of 100 meters.

3199 During construction phase, the designated waste collection and storage space should
3200 be at least 2% of the project site area. This space can be temporary, and the project
3201 has the flexibility to relocate it based on construction requirements.

3202 During post occupancy, the designated waste collection area should be within the
3203 site. For a population of up to 50,000, the building shall provide 2 bins for the storage
3204 of wet and dry waste. These bins should have a capacity of minimum 60 litres each,
3205 and the wet waste storage bin should have a lid (as per CIPET specifications).

3206 The project shall provide a centralized bin centre to store a minimum of 150 kg of
3207 waste per day. The bin centre must be adequately ventilated to ensure proper air
3208 circulation. The compliance shall be demonstrated with site plan highlighting the
3209 location of centralized bin centre.

3210 9.2.2 Segregation of waste

3211 The project team shall segregate the waste into minimum 4 categories as defined
3212 below during construction phase and store separately in the designated space.

- 3213 a) Concrete waste
- 3214 b) Broken bricks
- 3215 c) Metal waste – steel, Aluminium, copper
- 3216 d) Wood waste
- 3217 e) Plastics
- 3218 f) Tiles and ceramics
- 3219 g) Masonry waste
- 3220 h) Used paint tins / cans.
- 3221 i) Granite / Marble
- 3222 j) Glass

3223 NOTE: The list is not exhaustive.

3224 During post occupancy the waste generated shall be segregated into minimum of 2
3225 categories: dry and wet/ biodegradable wastes.

3226 List of Dry wastes:

- 3227
- 3228 a) Paper and plastic, all kinds
- 3229 b) Cardboard and cartons

- 3230 c) Containers of all kinds excluding those containing hazardous materials
- 3231 d) Packaging of all kinds
- 3232 e) Glass, all kinds
- 3233 f) Metals, all kinds
- 3234 g) Rags, rubber, wood
- 3235 h) Foils, wrappings, pouches, sachets and tetra packs (rinsed)
- 3236 i) Cassettes, computer diskettes, printer cartridges and electronic parts
- 3237 j) Discarded clothing, furniture, and equipment.
- 3238 List of Wet waste or biodegradable wastes

- 3239 a) Food wastes of all kinds, cooked and uncooked, including eggshells, bones
- 3240 b) Flower and fruit wastes including juice peels and house-plant wastes
- 3241 c) House sweepings (not garden sweepings or yard waste: dispose on-site)
- 3242 d) Household Inert (sweepings/ashes)
- 3243 * The list is only illustrative.

3244 The compliance shall be demonstrated in the site plan/ floor plan highlighting the
 3245 space dedicated to segregate different types of waste during construction phase
 3246 and post occupancy.

3247 9.2.3 Monitoring

3248 The project team shall quantify the waste generated category wise using the
 3249 weighing machine and maintain the records. The monitoring of the waste generated
 3250 shall be done once in a week during the construction phase and daily during post
 3251 occupancy. The project team shall provide the monitoring plan as part of the design
 3252 document.

9.3 Prescriptive requirements

3254 9.3.1 Reduction of waste during construction phase

3255 The waste generated during construction shall not exceed the limits as defined in
 3256 Table 9.1 for material category.

Table 9.1 Allowable percentage of wastage

| S No. | Waste material | % of waste generation |
|-------|---------------------|-----------------------|
| 1 | Cement | 5-8% |
| 2 | Reinforcement Steel | 10-15% |

| | | |
|----|------------------|--------|
| 3 | Concrete | 3-5% |
| 4 | Sand | 10-15% |
| 5 | Coarse Aggregate | 5-8% |
| 6 | Bricks | 5-10% |
| 7 | Wood | 1-3% |
| 8 | Tiles | 10-12% |
| 9 | Paint | 3-4% |
| 10 | Glass | 3-5% |
| 11 | Aluminum | 3-5% |

3258

3259 **Estimation of % of waste generation**

3260 The percentage of waste generation shall be calculated based on the estimated
 3261 quantity of waste generated in a particular category of material by the estimated
 3262 total quantity procured of the respective category of material utilised in the
 3263 project.

3264 The details of respective quantity of material utilised in the project can be
 3265 obtained from the inventory.

3266 % of waste Generation = $\frac{\text{Estimated quantity of waste generated}}{\text{From use of a particular material X100}}$
 3267
 3268

3269 $\frac{\text{Estimated quantity of waste generated}}{\text{From use of a particular material X100}}$
 3270 Total quantity of the respective material
 that will be procured in the project.

3271 **9.3.2 Reuse of waste in construction phase**

3272 Minimum 2% of the waste material generated from the project shall be reused. Eg;
 3273 utilization of the waste such as broken ceramic tiles in alternate place in projects.

3274 The reuse of material in the project shall be calculated from equation shown below.

3275 % of waste reuse= $\frac{\text{Total quantity of waste reused within the project site}}{\text{Total quantity of waste Generation}} \times 100$
3276

3277 9.3.3 Reuse of waste post occupancy

3278 100% of wet, biodegradable and organic waste shall be processed onsite using
3279 organic waste composter (OWC), bio digester or vermicomposting.

3280 The manure produced after the waste processing shall be used for gardening
3281 purposes within the site or in any other site.

3282 The compliance shall be demonstrated by,

3283 a) Site plan highlighting the location of organic waste composter, bio digester or
3284 vermicomposting.

3285 b) Specifications of OWC and bio digester indicating the capacity of waste that
3286 can be treated per day.

3287 9.3.4 Recycling of waste

3288 A state pollution control board or regulatory authority authorized recycling agency
3289 shall be appointed for recycling of the waste during construction phase and post
3290 occupancy phase.

3291 The compliance shall be demonstrated by a valid agreement with authorised recycler
3292 for recycling of the waste materials.

3293 9.3.5 Segregation of E- waste

3294 For populations of up to 50,000, the provision of separate bins for E-waste
3295 segregation should be made. These bins should have a minimum capacity of 20
3296 litres at the floor level and a minimum capacity of 60 litres at the site level.

3297 List of some E- waste shall include:

3298 a) Batteries from flashlights and button cells

3299 b) Car batteries, oil filters and car care products and consumables

3300 c) Light bulbs, tube-lights, and compact fluorescent lamps (CFL)

3301 9.3.6 Segregation of Domestic hazardous waste

3302 For populations of up to 50,000, the provision of separate bins for domestic
3303 hazardous waste should be provided. These bins should have a minimum capacity
3304 of 20 litres at the floor level and a minimum capacity of 60 litres at the site level.

3305 List of Some Domestic Hazardous Wastes shall include:

- 3306 (A)
- 3307 a) Aerosol cans
 - 3308 b) Bleaches and household kitchen and drain cleaning agents
 - 3309 c) Chemicals and solvents and their empty containers
 - 3310 d) Cosmetic items, chemical-based
 - 3311 e) Insecticides and their empty containers
 - 3312 f) Paints, oils, lubricants, glues, thinners, and their empty containers
 - 3313 g) Pesticides and herbicides and their empty containers
 - 3314 h) Photographic chemicals
 - 3315 i) Styrofoam and soft foam packaging from new equipment
 - 3316 j) Thermometers
 - 3317 k) Mercury-containing products

- 3318 (B)
- 3319 a) Injection needles and syringes after destroying them both.
 - 3320 b) Discarded Medicines
 - 3321 c) Sanitary towels,
 - 3322 d) Disposable diapers and
 - 3323 e) Incontinence pads (duly packed in polythene bags before disposal)

3324 9.3.7 Responsible disposal

3325 The waste that cannot be reused or recycled within the site shall be handed over to
3326 the authorised Treatment, Storage and Disposal facility (TSDF) in the city.

3327 The project team is required to maintain records and provide detailed information
3328 regarding the quantity of waste materials that have been responsibly disposed of.

3329 9.3.8 Liquid waste

3330 A building project complying to ESCBC code shall meet the requirements in terms of
3331 handling, storage and disposal of liquid hazardous waste generated during the
3332 construction phase and post occupancy.

3333 Project site shall have a dedicated closed storage space for storing liquid hazardous
3334 waste generated during the construction such as used oil, oil sludge, paint, and paint
3335 sludge. The storage area must be locked and prevented from unauthorized entry.

3336 The hazardous waste shall be stored in a container for a period of not more than 90
3337 days at the site.

3338 9.3.9 Gaseous waste

3339 The building project shall comply to the requirements, by meeting the emission
 3340 standards specified by the Central pollution control Board (CPCB) or state pollution
 3341 control board as applicable.

3342 *Emission standards*

3343 The emission standards need to be met for the diesel fired earth moving equipment,
 3344 material handling equipment and diesel power generators used within their
 3345 construction site.

3346 The emission limits for new engines used for power generating set (hereinafter
 3347 referred to as Genset) applications up to 800 kW Gross Mechanical Power, namely:

- 3348 a) Diesel engines.
- 3349 b) Engines based on dedicated alternate fuels;
- 3350 c) Engines based on Bi-fuels run either on Gasoline or on any one of the
 3351 alternate fuels;
- 3352 d) Engines based on Dual Fuel run on Diesel and any of the alternate fuels;
- 3353 e) Portable Generator sets (PI engines below 19kW and up to 800 cc
 3354 displacement) run on Gasoline fuel, dedicated alternate fuels and Bi-fuel
 3355 run either on Gasoline or on any one of the alternate fuels

3356 The emissions limits of the Genset is shown in Table 9.2 and Table 9.3. The
 3357 emissions limit from the construction equipment is shown in Table 9.4 and Table 9.5

3358

TABLE 9.2

3359 Emission limits for Genset engines up to 800 kW Gross Mechanical Powered by All CI
 3360 engines and PI engines > 800 cc engine displacement.

| Power Category, kW | NOx | HC*/** | NOx +HC*/** | CO | PM | | Smoke (light absorption coefficient) | |

| 130 ≤ P < 560 | | 3.5 | 0.19 | 0.4 | 0.015 | 1 × 10 ¹² | |
| P > 560 | | 3.5 | 0.19 | 3.5 | 0.015 | ----- | NRSC |

3380 The abbreviations used in Table 1 and Table 2 are as follows:

3381

a. NO_x – Oxides of Nitrogen;

3382

b. HC– Hydrocarbon;

3383

c. CO – Carbon Monoxide;

3384

d. PM – Particulate Matter;

3385

e. CI-Compression Ignition engines;

3386

f. PI- Positive Ignition engines;

3387

g. * HC stands for THC for diesel and gasoline;

3388 h. ** HC for alternate fuels shall be as defined in System and Procedure
3389 for Generator set.
3390

3391 **9.4 Documentation Requirements**

3392 Compliance shall be documented, and compliance forms shall be submitted to the
3393 authority having jurisdiction. The information submitted shall include, at a minimum,
3394 the following:

- 3395 1. Brief description of the type of project with location, total area, number of
3396 occupants and operating hours.
- 3397 2. Brief description of system in place of segregating and monitoring the waste
3398 generated within the project site.
- 3399 3. Summary of various types of waste generated and their quantities. During
3400 construction phase provide the total quantity of waste generated for each
3401 type of waste and in case of operation and maintenance phase provide the
3402 quantity of waste generated for each type of waste on annual basis.
- 3403 4. Brief description on the efforts taken to reduce, reuse and recycle the waste
3404 or meeting the norms in case of gaseous waste.
- 3405 5. Details highlighting the compliance to mandatory and prescriptive
3406 requirements of the code.
- 3407 6. Copy of the documents such as agreements with third party waste handlers
3408 / service providers, bills / vouchers for having handed over the waste for
3409 recycling.

3410 **9.5 Normative References**

3411 The following referenced documents are indispensable for the application of this
3412 document. For dated references, only the edition cited applies. For undated
3413 references, the latest edition of the referenced document (including any
3414 amendments) applies.

3415 The following Standards contain provisions which through reference in this text,
3416 constitute provisions of the standards. At the time of publication, the editions
3417 indicated were valid. All standards are subject to revision and parties to
3418 agreements based on this standard are encouraged to investigate the possibility
3419 of applying the most recent editions of the Standards indicated below:

| Standard Number/Regulation | Title |
|--|--|
| SP 7: 2016 | National Building Code of India 2016 (NBC 2016) |
| IGBC Net Zero waste Pilot Version | Indian Green Building Council Reference Guide on Net Zero Waste Rating systems |
| CPHEEO chapter 9 | Storage Of Waste At Source |
| Municipal solid waste management manual: Part II | Manual on Municipal Solid Waste Management |

3422

3423

3424

Section 10

SUSTAINABLE MATERIALS

DRAFT FOR STAKEHOLDER CONSULTATION

3425 **General**

3426 ECSBC requires the buildings to report the embodied carbon in kgCO₂-eq/Sqm. The
3427 reporting of the embodied carbon is limited to the A1-A3 life stage as defined in EN
3428 15978.

3429 **1) Purpose**

3430 The purpose of reporting embodied carbon as part of the Energy Conservation and
3431 Sustainable Building Code is to disclose the initial embodied carbon emissions from
3432 the building construction materials used in commercial buildings in India.

3433 **2) Scope**

- 3434 a) Applicable to all buildings under the purview of ECSBC
- 3435 b) Applicable to building materials used in structural systems and building
3436 envelop systems namely all kinds of foundations, retaining walls,
3437 substructure as part of the structural system, superstructure such as but not
3438 limited to beams, columns, sheer walls, opaque and non-opaque structural
3439 and non-structural external walls, structure for mezzanine floors and loft
3440 floors, floors, ceilings, roofs, staircases and ramps, fenestration such
3441 windows, skylights and ventilation openings.

3442 **3) Exclusions**

- 3443 a) The approach does not include materials used in electro-mechanical
3444 systems, plumbing systems, firefighting systems, elevators, finishing
3445 materials including wall, floor and ceiling finishes, or any other kind of non-
3446 structural elements such as railings, parapet walls, or built-in furniture.

3447 **4) Definition**

3448 Please refer to EN 15978 for the definitions:

3449 Stages of assessment (as per EN 15978) (CEN, 2011)

- 3450 • Product (A1-A3): The boundary for modules A1 to A3 covers the 'cradle
3451 to gate' processes for materials used in the building. These numbers are
3452 typically declared as a sum of A1 to A3 by the manufacturers. Building
3453 developers can ask for these numbers when choosing a building

3454 material. These numbers should be in accordance with EN 15804. (CEN,
3455 2019)

3456 **5) Method of calculation:** Annexure-A contains the Comma Separated Value (CSV)
3457 Spreadsheet format. The fulfilment of Annexure-A requirements should be
3458 demonstrated by reporting all the data required in the format.

3459 **6) Annexure:**

3460 a) *Please refer attached Annexure-A*

3461

DRAFT FOR STAKEHOLDER CONSULTATION

3462

Annexure-A

3463

Table 1-1 Introduction

| |
|--|
| For Embodied Energy Data Collection: |
| Applicable to building materials used in structural systems and building envelop systems, namely all kinds of foundations, retaining walls, substructures as part of the structural system, super structures such as but not limited to beams, columns, sheer walls, opaque and non-opaque structural and non-structural external walls, structure for mezzanine floors and loft floors, floors, ceilings, roofs, staircases and ramps, fenestration such windows, skylights and ventilation openings. |
| The project for ECSBC compliance shall gather primary data for embodied energy of construction materials including but not limited to the ones mentioned in the sheets. The system boundary is Cradle to Gate, i.e., unit processes A1 to A3. The data for the same is required to be entered in sheets 'A1', 'A2', and 'A3'. |

3464

3468

Table 1-2 Introduction

| |
|---|
| For Site Selection: |
| Site: refers to a Project/Site. It may comprise one or more buildings. |
| Building: refers to an individual building block of the Site. |
| The availability of Bill of Quantities (BoQ) and material supplier details is a must. |
| This annual projected electricity data as reported for ECSBC Compliance. |

3469

Table 2 -1 Details

| Sheet Name | Description |
|---|--|
| Building Information | Sheet that contains background details of the selected building(s). An example has been presented in the sheet. |
| BoQ | Bill of Quantities: Sheet meant for recording quantities of construction materials. In this sheet, the BoQ of multiple Sites may be entered in adjacent columns. For example, BoQ details of S1_B1 can be added in columns B to I, and S2_B1 can be added in columns J to Q and so on. |
| A1 Extraction and Procurement | Sheet for entering embodied energy/carbon attributed to 'Raw material extraction and procurement' |
| A2 Transport | Sheet for entering embodied energy/carbon attributed to 'Transport to manufacturing plant' |
| A3 Manufacturing | Sheet for entering embodied energy/carbon attributed to 'Manufacturing' |
| Sum of A1 to A3 | Sheet for presenting total embodied energy/carbon for stages A1 to A3. This sheet contains tow categories of resultant embodied energy/carbon: a) it may be calculated using the data gathered in sheets A1 to A3 if data of that granularity is available), b) it may be directly obtained from the manufacturer (if data of individual unit process granularity is not available). |
| Building ELE CON | Sheet for recording the annual electricity consumption of the building |

| | |
|---|--|
| Prominent Manufacturers | Sheet for recording the dominant companies/manufacturers in that region. This may help when the material source is unknown and it is safe to assume that it may be from the companies having the highest market penetration. |
| Validation Tables | Sheet contains background information used for creating drop downs for certain columns |

3470

3471

Table 2-2 Details

| Concerned Sheet | Column Headers | Description | Data Type |
|--------------------------------------|----------------|---|-----------|
| All | | Site: refers to an Affordable Housing Project/Site. It may comprise one or more buildings | |
| All | | Building: refers to an individual building block of the Site | |
| Building Information | Address | Refers to the Address of the selected Building and Site | |
| | Nomenclature | Refers to the alphanumeric nomenclature assigned to the selected Building. It is in the format "XYZ_S1_B1", "XYZ_S2_B1", where XYZ is the Airport code / nearest Airport code, S1 indicates the Site ID, and B1 refers to the selected building from that Site. As of now, we are targeting one Building from each Site. In case of design variations across different Buildings belonging to the same Site, more than one buildings may be selected | |
| | Latitude | Refers to the latitude of the selected Site | |

| | | |
|----------------------------------|---|--|
| Longitude | Refers to the longitude of the selected Site | |
| No. of floors in the building | Indicates the number of floors in the building. If the building has: a) only ground floor, please enter G b) more than one floor, and there are built up spaces on the ground floor, please enter G+ no of floors c) more than one floor on top of a stilt parking, please enter S+ no of floors | |
| Bill of Quantity (BoQ) Available | Indicates the availability of Bill of Quantities data. Data for this column shall be selected from the drop down. If the BoQ of all the materials within the study's scope is available, then please select "Yes-Fully Available"; if the data for any material(s) is unavailable then select "Yes-Partly Available"; and if no BoQ data is available then select "Not Available" | |
| BoQ data source | Indicates the source from which the BoQ data has been obtained. Please select from the available options mentioned in the drop down: Material Supplier Contractor/Designer Owner (refers to the owner of the building) Tender Document Government DPR Architectural Drawings | |
| Make and Model Details Available | Indicates the availability of Make and Model related data of construction materials. Here, Make refers to the material manufacturer and Model refers to the specific product details. Data for this column shall be selected from the drop down. If the details of all the materials within the study's scope are available, then please select "Yes-Fully Available"; if the data for any material(s) is unavailable then select "Yes-Partly Available"; and if no BoQ data is available then select "Not Available" | |

| | | |
|-----------------------------------|--|--|
| <p>Make and Model data Source</p> | <p>Indicates the source from which the material-related data has been obtained. Please select from the available options mentioned in the drop down: Material Supplier Contractor/Designer Owner Tender Document Government DPR Architectural Drawings</p> | |
| <p>Building Drawings</p> | <p>Indicates the availability of architectural drawings for the Building. Data shall be selected from the drop down list having the following options: Yes-Fully Available Yes-Partly Available Not Available</p> | |

DRAFT FOR STAKEHOLDER CONSULTATION

| | | | |
|---------------------|------------------------|---|---------|
| | Building Layout (file) | This cell contains the link to the digital file of architectural drawings of the selected Building. The file may be ".dwg" or in image format. Please upload image/cad file of layout over Gdrive folder and paste link here | |
| | Built up area (sq. m) | Indicates the built up area of the building. In case more than one building configurations exist in the same site, please add its built up area in the next column. | |
| | Sr. no. | For this sheet, the materials have been segregated into Concrete, Steel, Walling Materials and so on, and have been numbered from 1 to 7. Update this sheet with more material, in their respective categories, as and when information of Sites becomes available. | |
| BoQ | Material | Provides the list of construction materials that are formed by one or more 'Raw Components'. For example, concrete is a material which is made up of cement, sand, and aggregate. | |
| | Unit | Refers to the measurement unit as mentioned in the BoQ | |
| | Qty(a) | Refers to the quantity of the 'Material' as mentioned in the BoQ | |
| | Raw Components | Breaks down composite construction 'Materials' into their 'Raw Materials'. Can add any new 'Raw Materials' here, as and when information from Sites is collected. | Primary |
| | Unit | Refers to the measurement units of 'Raw Materials'. | Primary |
| | Qty(b) | Mentions the calculated quantities of 'Raw Materials' | Primary |
| | Functional Unit (kg) | Refers to the functional unit-kg, followed in this study. All calculated quantities must be converted to this unit | Primary |
| | Qty(c) | Refers to the 'Raw Material' quantities mentioned in kg | Primary |

| | | | |
|--|---|---|------------|
| | Qty of Raw Material Extracted and Procured | Refers to the quantity of the Raw Materials to be extracted and procured for producing, say, 1 MT (1 unit) of the finished construction material. Many manufacturers calculate the embodied energy/carbon in reference to a certain qty of final product. For example, in their annual sustainability reports, cement manufacturers mention the embodied carbon values per MT of cement. | Calculated |
| A1_ Extraction and Procurement, A2_ Transport, and A3_ Manufacturing | Unit (RM) | Refers to the measurement unit of Raw Materials | Primary |
| | Reference Qty of finished construction material | Refers to the quantity of finished Construction Material for which the embodied energy data is being collected. For example, the manufacturer might provide the MJ of energy used in production of 1 MT cement. Thus, the "qty of finishes construction material" would be 1 MT. | Primary |
| | Unit (FCM) | Refers to the measurement unit of finished construction material | Primary |
| | Fuel Mix | Refers to types of fuels used in the extraction and procurement processes | Primary |
| | Embodied Energy | Refers to the energy consumed during the extraction and procurement processes | Primary |
| | Unit (EE) | Indicates the unit in which embodied energy is reported. Units shall be selected from the following drop down options: MJ kWh | Primary |
| | Embodied Carbon | Refers to the carbon released during the extraction and procurement processes | Primary |
| | Unit (EC) | Indicates the unit in which embodied energy is reported. Units shall be selected from the following drop down options: kg CO2 (assuming the emissions of rest of the GHG as 0) kg CO2e (includes the emissions of other GHG like CH4 and N2O) | Primary |
| | Source of Data | Refers to the source of the embodied energy/carbon associated with raw material extraction and procurement data. This data may be sourced from: Material supplier Estimated from machine readings Contractor/Designer EPD Company Annual Reports | Primary |

| | | | |
|---|---|--|---------|
| | Data Type | <p>Refers to the type of data - Measured, Derived, or Calculated</p> <p>Measured data - refers to the data that the manufacturer/supplier has measured</p> <p>Derived data - refers to data that has been derived using some kind of conversion factors. For example, if embodied energy is available in MJ/cum and the density is available, then it can be used to derive embodied energy in MJ/kg</p> <p>Calculated data - refers to the data which is calculated/estimated through indirect means. For example, if the total weight of coal used is not available, but the generator capacity and the amount of time for which the generator was running, and in how much time does the generator exhaust all the coal is available. Then, the amount of coal used can be calculated by multiplying the time taken for all the coal to be exhausted and the generator capacity, and dividing it by the time for which the generator was running.</p> | |
| | <p>Please Note: In the A1_ Extraction and Procurement sheet -</p> <p>a) if embodied energy/carbon data at the process-level granularity is available, then the data must be entered in columns C through U</p> <p>b) if the combined embodied energy/carbon data of extraction and procurement is available, then data must be entered in columns V to AC</p> | | |
| A1 Extraction and Procurement | Supplier/Manufacturer | Refers to the Manufacturer/Supplier of the Construction Materials | |
| | Process: Raw Material Extraction | This refers to the processes involved in mining the Raw Components of Construction Materials | Primary |
| | Process: Raw Material Procurement | <p>Refers to the processes involved in Raw Component procurement.</p> <p>The difference between raw material extraction and procurement can be understood by the following example. To manufacture plywood panels, first the tress need to be felled. The process of cutting tress would be included in 'Raw Material Extraction', and any processes involved in taking those felled tree barks from the point of mining to the point from where they would be transported shall be included in 'Raw Material Procurement'</p> | |
| | Processes involved in Raw Material | Please mention all processes involved in Raw Material extraction and procurement. For example, cutting, hammering etc. | |

| | | | |
|------------------------------|--|---|------------|
| | Extraction and Procurement | | |
| | Raw Material | Refers to the raw materials used up for producing the Construction Materials. May add raw materials for each of the construction materials, and number them in the following format: 1.1, 1.2, etc. where 1 is the sr. no. of the Construction Material. | Primary |
| | Calculated: Embodied Energy | Refers to the resultant embodied energy calculated by summing the values mentioned for raw material extraction and procurement | |
| | Calculated: Embodied Carbon | Refers to the resultant embodied carbon calculated by summing the values mentioned for raw material extraction and procurement | Calculated |
| | Distance between Extraction Site and Manufacturing Plant | Indicates the distance between the raw material extraction site and manufacturing plant | Calculated |
| A2 Transport | Were more than one vehicle involved in transport | Yes/No type of question. In case more than one vehicles were used, the vehicle capacity, fuel mix, total fuel used for each of the cases must be added in columns underneath 'Vehicle 1', 'Vehicle 2' etc. | Primary |
| | Vehicle Category | Refers to the category of vehicle, i.e., Light Duty Vehicle (LDV), Medium Duty Vehicle (MDV), or Heavy Duty Vehicle (HDV) | Primary |
| | Vehicle Capacity (Tonne) | Indicates the vehicles's capacity in tonnes | Primary |
| | Vehicle Used: Make | Indicates the manufacturer of the vehicle used | Primary |
| | Vehicle Used: Model | Indicates the product/model of vehicle used | Primary |

| | | | |
|----------------------------------|--|--|------------|
| | No. of trips | This shall be calculated on the basis of total material required divided by the distance between the raw material extraction point and manufacturing plant | Primary |
| | Fuel Mix | Indicates the fuel used for transportation. Data shall be chosen from the following drop down options: Petrol Diesel Coal | Calculated |
| | Total Fuel Used | Indicates the total fuel consumed | Primary |
| | Unit (Fuel Use) | Refers to the measurement unit used to express the used fuel. For example, litres of petrol, MT of coal etc. | Primary |
| | Sub-level | Refers to the alphabetic categorization assigned to various production methods/technologies available for Construction Materials. | Primary |
| | Variation in Method/Technology | Indicates the various production technologies/methods for manufacturing a Construction Material | |
| A3 Manufacturing | <p>Please Note: In the Sum of A1 to A3 sheet:</p> <p>a) if granular data was available and filled up in the previous sheets, then that very data would be linked and displayed in columns H to S</p> <p>b) if the combined embodied energy for A1, A2, and A3 is directly available from the manufacturer, then it must be entered in columns T to AC</p> <p>Also, the details in columns B to G must be entered .</p> | | |
| Sum of A1 to A3 | Address | Column where the building address must be entered | |
| Building ELE CON | Nomenclature | This is our nomenclature or identification given to the building, in the format Airport Code_S1_B1. | Primary |
| | Annual Electricity Consumption (unit: kWh) | This is the sum of electricity consumed across the year in kWh (of the building) | Primary |

| | | | |
|--|-----------------------------------|---|---------|
| | Year of data | Indicates the year for which electricity data is presented | Primary |
| | Bimonthly Electricity Consumption | This is the electricity consumed across two consecutive months in kWh (of the building). This data may be entered in the respective month's column. | Primary |
| | Address | Column where the Building address must be entered | Primary |
| Prominent Manufacturer | | | Primary |

Section 11

3498

INDOOR ENVIRONMENT QUALITY

3499

DRAFT FOR STAKEHOLDER CONSULTATION

3500 **11.1. General**

3501 The building shall comply with the mandatory provisions for all the four significant
3502 Indoor Environment Quality (IEQ) parameters – Indoor Air Quality (IAQ), Visual
3503 comfort, Thermal comfort and Acoustics as defined in clause 11.2.

3504 Note:

3505 Compliance to IEQ parameters through modifications in building components and
3506 systems, may have adverse impact on energy efficiency. Hence it is imperative to
3507 define threshold levels for indoor environment parameters to ensure that buildings
3508 attain multiple objectives of meeting the energy efficiency without compromising on
3509 good indoor environment for efficient functioning of activities and wellbeing of its
3510 occupants.

3511 **11.2. Mandatory requirements:**

3512

3513 **11.2.1. Indoor air quality (IAQ):**

3514 **a) Source control for PM10 and PM2.5:**

3515 The HVAC system of all ECSBC, ESCBC+ and Super ECSBC buildings shall use
3516 air filter conforming to IS/ISO 16890 Part 1 to Part 4.

3517 **b) Source control for CO₂**

3518 1) The ECSBC compliant buildings shall be designed to operate their ventilation
3519 systems based on design ventilation rates for perceived air quality and shall
3520 conform to Section 5 – Clause 5.2.1 of this ECSBC code.

3521 2) In addition, the ECSBC+ compliant buildings shall install devices to measure
3522 and control HVAC equipment to regulate and maintain the ventilation rate for
3523 non-residential building excluding healthcare and industrial buildings as
3524 defined in section 5 – clause 5.2.1.3 of this ECSBC code.

3525 3) In ECSBC Super compliant buildings, sensors shall be integrated with the
3526 control to continuously monitor and regulate the ventilation rate control to
3527 maintain comfort ventilation rates for non-residential buildings excluding
3528 healthcare and industrial buildings as defined clause 5.2.1.3 of in section 5 of
3529 this ECSBC code.

3530

3531 **c) Source control of Volatile Organic Compounds (VOCs) and Aldehydes**
3532 **emissions:**

3533 All ECSBC Plus and Super ECSBC buildings, the construction materials like
 3534 gypsum board, wood, paint, varnish, furniture, carpet etc., shall be with
 3535 low VOC emissions and shall comply to standards listed below:

- 3536 1) The electronic equipment shall be tested as per ISO/IEC 28360 -1 or ISO/IEC
 3537 28360-2: Information technology — Determination of chemical emission
 3538 rates from electronic equipment.
- 3539 2) The building material shall be tested as per ISO 16000-9: Determination of
 3540 the emission of volatile organic compounds from building products and
 3541 furnishing — Emission test chamber method.
- 3542 3) UL 2818 GREENGUARD Certification Program for Chemical Emissions 209or
 3543 Building Materials, Finishes and Furnishings
- 3544 4) UL 2819 GREENGUARD Certification Program for Chemical and Particle
 3545 Emissions for Electronic Equipment
- 3546 5) ANSI/BIFMA X7.1-2011(R2021) Standard for Formaldehyde and TVOC
 3547 Emissions of Low-emitting Office Furniture and Seating
 3548

3549 **11.2.2. Thermal Comfort**

3550 Thermal conditions play a critical role in influencing occupant comfort and well-
 3551 being. This sub-section specifies thermal environmental conditions that are suitable
 3552 for healthy adults at:

- 3553 a. Atmospheric pressure equivalent to altitudes up to mean sea level of
 3554 3000 m.
- 3555 b. Indoor spaces designed for human occupancy for periods not less
 3556 than 15 minutes.

3557 In conditioned buildings, the values for quality of thermal environment parameters
 3558 for representative occupant of a space shall be as specified in Table 11.1.

3559 **Table 11.1: Conditions for thermal comfort measurement**

| Air velocity | Weather condition | Level of activity | Reference table or Threshold Values |
|--------------|-------------------|-------------------|-------------------------------------|
| Up to 0.2m/s | Summer / winter | Met value ≤ 1.2 | Table 11.2 |

| | | | |
|--------------|-----------------|----------------------|------------------------------|
| Above 0.2m/s | Summer / winter | Met value ≤ 1.2 | Table 11.2 + Figure 11.1 |
| - | Summer | - | Relative humidity: 30 to 70% |

3560

3561

3562 **Table 11.2. Acceptable range of operative temperature with air velocity up to 0.2**
 3563 **m/s**

| Level of Activity | Operative Temperature ($^{\circ}\text{C}$) | |
|------------------------|--|---|
| | Summer (Cooling season) ~ 0.5 clo | Winter (Heating season) ~ 1.0 clo |
| Met >1 and up to 1.2 | 23.0 ± 3.0 | 19.0 ± 4.0 |
| Met ≤ 1.0 | 24.5 ± 2.5 | 22.0 ± 3.0 |

3564

3565

3572

3573

3574

3575

3576

11.2.2.1 Prescriptive requirement:

3577

3578

3579

3580

3581

3582

3583

- a) Conditions for special purpose buildings such as Operation theatres, clean rooms shall be governed by norms prescribed by appropriate authorities.
 - b) Clothing insulation is expressed in **clo** units. The clo has the units as square metre kelvins per watt or $\text{m}^2\cdot\text{K}/\text{W}$, used to describe insulation used in residential and commercial construction, — higher the value, the better the insulation performance.
 - c) $1 \text{ clo} = 0.155 \text{ K}\cdot\text{m}^2\cdot\text{W}^{-1}$. One clo is the amount of insulation that allows a person at rest to maintain thermal equilibrium in an environment at 21°C in a normally ventilated room (0.1 m/s air movement).
- a) ECSBC+ compliant buildings shall be designed to have relative humidity control within the range of 30% to 70% in summer.
 - b) Super ECSBC buildings shall also be designed to have relative humidity control within the range of 30-70% during summer as well as winter conditions. Super ECSBC buildings shall also meet the additional design conditions as given in Table-11.3.

3584 **Table 11.3. Additional requirements for thermal comfort in Super ECSBC buildings**

| Parameters | Units | | Super ECSBC |
|---|-------|--------------|-------------|
| Radiant Temperature Asymmetry | °C | Warm Ceiling | <7 |
| | | Cool Wall | <13 |
| | | Cool Ceiling | <18 |
| | | Warm Wall | <35 |
| Vertical Air Temperature Difference | °C | | 4 |
| Floor Surface Temperature (Only for floor-based cooling/heating) | °C | | 17 - 31 |

3585

3586 **11.2.2.3 Method of calculating operative temperature for air velocity up to 0.2**
 3587 **m/s**

3588 The operative temperature shall be calculated as below.

3589
$$t_o = \frac{(t_{mr} + (t_a \times \sqrt{10}))}{1 + \sqrt{10}\vartheta} \dots\dots\dots \text{Eq. 11.1}$$

3590

3591 where,

3592 ϑ = air velocity

3593 t_a = air temperature

3594 t_{mr} = mean radiant temperature

3595

3596 It is also acceptable to approximate this relationship for occupants engaged in near
 3597 sedentary physical activity (with metabolic rates between 1.0 met and 1.3 met), not
 3598 in direct sunlight, and not exposed to air velocities greater than 0.20 m/s.

3599

3600
$$t_o = \frac{(t_{mr} + t_a)}{2} \dots\dots\dots \text{Eq. 11.2}$$

3601

3602

3603 **Figure 11.1. Required Air Speed to Offset Increased Operative Temperature (in**
 3604 **Celsius)**

3605

3606 Example: If in a given room, an occupant is involved in the moderate level of activity,
 3607 air speed in room is 0.9 m/s and operative temperature is 27°C, then by using above
 3608 mentioned graph, Δt is 3.3°C. It makes acceptable room air temperature of 27°C +
 3609 3.3°C.

3610 For the purpose of showing compliance, representative sample locations shall be
 3611 the locations where most extreme values of the thermal parameters are observed
 3612 or likely to occur to occur (e.g., potentially occupied areas near windows, diffuser
 3613 outlets, corners, and entry/exit).

3614 **11.2.3. Visual Comfort**

3615 For all interior spaces, lighting quantity and quality parameters shall conform to IS
 3616 3646 (Part 1) for illumination level, glare index according to visual task and IS 10322

3617 (Part 5/section 1 and 2) and IS 16017 (Par 1) for quality of luminaires for all
3618 application areas.

3619

3620 In addition, buildings shall meet the threshold values of parameters of lighting
3621 comfort as given below. Compliance shall be shown through lighting simulation
3622 under no daylight conditions.

3623

3624 a) Illuminance level for all areas shall be as defined in Part 5, section 1 to 5 of
3625 NLC 2010 which describes the illumination level of interior illumination of
3626 hospital, educational, industrial, indoor public places and office lighting.

3627 b) Minimum uniformity of illuminance in task area shall be 0.7 as per NLC 2010
3628 Part 5

3629 c) Minimum uniformity of illuminance at immediate surrounding areas shall be
3630 0.5 as per NLC 2010 Part 5.

3631 d) Illuminance of the immediate surrounding areas shall be as per NLC 2010.

3632

3633 **11.2.3.1 Prescriptive requirement:**

3634 Minimum 90% percent of the workstations shall meet the required
3635 illuminance at task plane for ECSBC and ECSBC Plus buildings, and
3636 100% for Super ECSBC buildings.

3637

3638 **11.2.4. Acoustics comfort**

3639 The controlling of noise in and around buildings is essential. The new buildings and
3640 the refurbished buildings shall demonstrate compliance through prescriptive
3641 method as defined below or through computer aided simulation tools.

3642 **11.2.4.1 Prescriptive requirements**

3643 Isolation between Building Elements depends upon the following factors:

3644 a) Junction detail between the separating wall/floor

3645 b) Mass of flanking elements

3646 c) Transmission through floor voids, loft spaces, service ducts, mullions and
3647 similar paths.

3648

3649 The building material shall be selected based on **acoustic** insulation properties of
3650 the material as specified in table 11.4. The standard laboratory measurements of
3651 airborne sound insulation in accordance with BS EN ISO 10140-2 and impact sound

3652 insulation in accordance with BS EN ISO 10140-3 or any other equivalent standard
 3653 should be considered as a guide to the performance of an element in the field.

3654

3655 In case of Super ECSBC, post building construction, field tests for sound insulation
 3656 shall be conducted in accordance with BS EN ISO 140-4 and BS EN ISO 140-7. From
 3657 these measurements, single-number ratings can be calculated according to BS EN
 3658 ISO 717-1, for airborne insulation, and BS EN ISO 717-2, for impact insulation.

3659

3660 The threshold Noise isolation class (NIC) depending on type of spaces shall be as per
 3661 the table 11.7.

3662

3663 **Table 11.4 Default sound insulation values of the different walls and Glazing.**

| Sl# | Partition (Dry and wet walls) | Rw/STC |

| 3150 | 19 | 33 | 40 | |
| 4000 | 20 | 34 | 39 | |

3670

3671 Transmission loss for Acoustical Louvers is defined in Table 11.6.

3672 Table 11.6: Transmission loss for acoustical louvers

| Depth of acoustical Louver Single Blade (mm) | 63 | 125 | 250 | 500 | 1000 | 2000 | 4000 | 8000 |
|--|----|-----|-----|-----|------|------|------|------|
| 100 | 5 | 4 | 5 | 6 | 9 | 13 | 14 | 13 |
| 150 | 6 | 6 | 8 | 10 | 14 | 18 | 16 | 15 |
| 300 | 6 | 7 | 10 | 12 | 18 | 18 | 14 | 13 |
| 600 | 7 | 9 | 12 | 24 | 31 | 33 | 29 | 30 |

3673

3674 **11.2.4.2 Calculating acoustical transmission loss:**

3675 Normalized transmission loss shall be calculated using the equation 11.7 and

3676 Random transmission loss using equation 11.8.

3677 Normalized transmission loss, TL_N

3678 $TL_N = 10 \log \left\{ 1 + \left(\pi \times F \times \frac{S}{(S_o \times C_o)} \right)^2 \right\} \dots \dots \dots \text{Eq. 11.3}$

3679 $\pi = \frac{22}{7}$

3680 F = Center frequency

3681 S= Surface density

3682 $(S_o \times C_o)$ = Characteristic impedance, 415 Rayls

3683 Random transmission loss is then calculated using normalized transmission using
3684 the below mentioned formula,

3685 $TL_R = TL_N - (10 \log 0.23 \times TL_N) \dots \dots \dots \text{Eq. 11.8}$

3686

3687 Table. 11.7: The threshold Noise isolation class depending on type of spaces

| Sl. No. | Building | Type of space | Dw/NIC | | |
|---------|---------------|---|-------------|--------|-------|
| | | | Super ECSBC | ECSBC+ | ECSBC |
| 1 | Office | Between two enclosed offices | 45 | 40 | 40 |

Section 12

COMMISSIONING OF BUILDING SYSTEMS

DRAFT FOR STAKEHOLDER CONSULTATION

12. Commissioning of Building Systems

3694

3695

12.1 General

3697

3698 Structured methodology for Commissioning of various systems in a building
3699 Systems is essential to ensure that all systems, sub systems and equipment
3700 perform optimally to meet the design requirements and necessary
3701 documentation is provided and adequate training on operation and
3702 maintenance is imparted to the designated personnel.

3703

3704 NOTE: This section does not define:

- 3705 a) Equipment or system performance levels
- 3706 b) Specific technical requirement of commissioning of each building system or
3707 equipment.
- 3708 c) Scope of commissioning of a specific building may vary depending on the
3709 project size, complexity, specific requirements of the owner/end user or the
3710 local regulatory Authority Having Jurisdiction (AHJ). However, this code
3711 defines the process which has to be followed in each and every case.

12.1.1 Applicability

3713

3714 The provisions of this section shall apply to all building typologies covered by
3715 the code and across all climatic zones whose built up area (excluding any non-
3716 air-conditioned basements) exceed 5000m².

3717 The following building systems, if present in the specific building under
3718 consideration) shall require to follow the commissioning process as set out in
3719 this section.

- 3720 a) Building Envelope Systems.
- 3721 b) Electrical systems including power receiving and distribution as well as
3722 Stand by Generation / On site generation systems.
- 3723 c) On-site renewable energy systems.
- 3724 d) Water supply and drainage systems including pumping systems and hot
3725 water generation/distribution systems.

- 3726 e) Water and Sewage water treatment and recycling systems.
- 3727 f) Heating, ventilation and Air Conditioning systems.
- 3728 g) Vertical transportation systems.
- 3729 h) Solid waste handling, management and disposal systems.
- 3730 i) Building management and Building Automation Systems.
- 3731 j) Lighting systems (both internal and external) including dimming
- 3732 systems.

3733

3734 NOTE: The fire, life safety and disaster management requirements shall conform the
3735 local regulations.

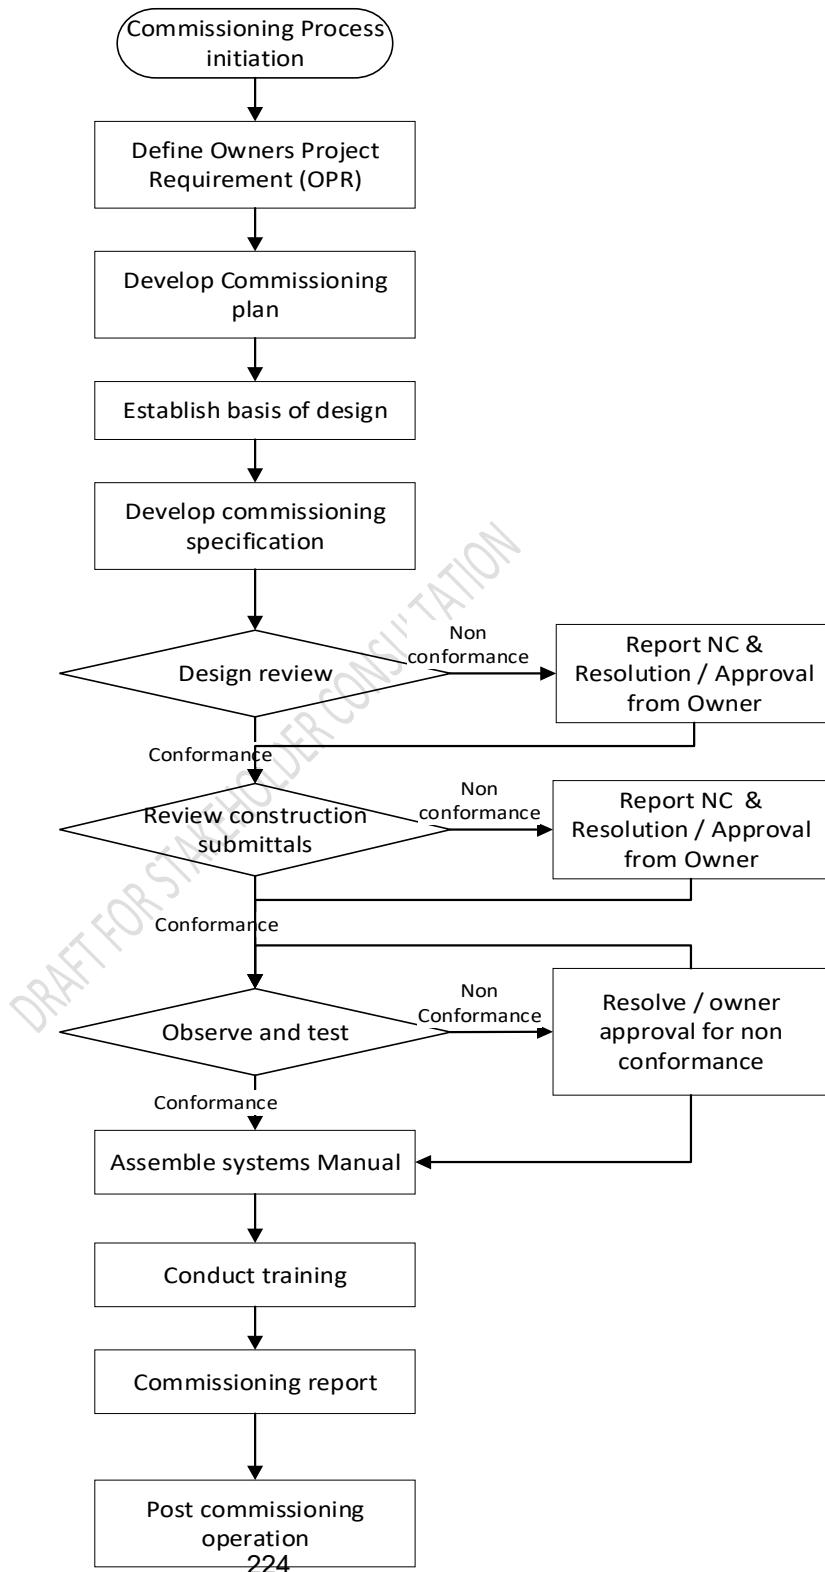

3736

3737 **12.2 Mandatory requirements for ECSBC Buildings**

3738

3739 **12.2.1** A systematic approach as detailed in the flow chart (**Figure 12.1**) shall
3740 be followed for commissioning of each building system.

3741

3774

3775

3776

12.2.2 Owner shall designate a Commissioning Authority (CxA) right at the initiation of the building project. CxA shall either be an employee of the Owner or a member of the design team expressly designated for that purpose by Owner. He/She also may be a Third Party Commissioning agent appointed directly by the Owner.

12.2.3 Owners Project Requirements (OPR) shall be developed by the CxA with inputs from architects and all other members of the design team. OPR shall be approved by the Owner.

12.2.4 Based on the OPR and the scope of the building project, CxA shall develop the Commissioning Plan for each of the building systems applicable to the project. This commissioning plan duly accepted and signed by the Owner shall be submitted to the AHJ as part of code compliance requirements.

12.2.5 Commissioning plan, at a minimum, shall include the following in respect of each of the building systems.

- a) Commissioning process overview
- b) Appointment/engagement letter of CxA.
- c) Documentation requirements including systems manual, commissioning report and training records (Note: These documents are not required at this stage)
- d) Test and verification requirements.
- e) Resolution process for non-compliance

12.3 Prescriptive Requirements of ECSBC Plus buildings

12.3.1 In addition to the requirements of the Commissioning Plan for ECSBC Compliant buildings, the following additional aspects shall be covered in the commissioning plan for ECSBC+ buildings.

3777

3778

a. Construction checklists for all equipment and subsystems.

3779

b. Test procedures for each equipment, sub system and system

3780

c. The Commissioning Plan shall assign clear responsibility to the

3781

agency who will perform each test and record the result as well

3782

as the agency who will approve the test result as satisfactory.

3783

for test procedure shall assign clear responsibility of the CxA

3784

team for each test.

3785

d. Seasonal and post occupancy testing requirement shall be part

3786

of the commissioning plan.

3787

e. Owner shall provide an undertaking that the Commissioning

3788

Plan shall be in force for one year post occupancy and during

3789

this period, building performance with respect to energy and

3790

water consumption shall be monitored and recorded.

3791

f. Building shall have a Building Management System which will

3792

bring all parameters regarding power and water consumption

3793

to a common dashboard to enable monitoring and control.

3794

Building owner shall be required to give an undertaking to this

3795

effect to the AHJ while applying for compliance with code.

3796

3797 **12.4 Additional requirement for Super ECSBC buildings**

3798

3799 **12.4.1** In addition to the mandatory requirements under clause 12.2 and

3800 prescriptive requirements under clause 12.3, Super ECSBC Buildings

3801 shall comply with the following. CxA shall be a third party duly certified

3802 by an accredited agency.

3803

3804 **12.4.2** CxA designated by the owner shall be either a member of the owner's

3805 organization or a Third party agency directly appointed by the owner.

3806 Members of the design or execution agencies shall not be the

3807 designated CxA.

3808

3809 **12.4.3** The CxA appointment shall extend to the post occupancy stage and CxA

3810 shall be responsible for continuous commissioning of the systems for a

3811 minimum 3-year period post occupancy. Necessary undertaking by the
3812 building owner in this regard shall be submitted to AHJ. During this
3813 period, CxA shall be responsible for continuous monitoring of the
3814 building systems from energy and water consumption points of view
3815 and necessary records shall be maintained.

3816

3817 **12.4.4** IoT enabled monitoring and data analytics for building systems shall be
3818 provided in the design. These shall cover monitoring and recording of
3819 and for energy and water usage.

3820

3821 **12.4.5** IoT enabled system for preventive and predictive maintenance shall be
3822 included in the design.

3823

3824 **12.5 Controls for Commissioning.**

3825

3826 **12.5.1** Installation of sensors, detectors, measuring devices and controls
3827 during construction stage is essential for proper commissioning of the
3828 system. These shall be clearly stated in the commissioning plan.

3829

3830 **12.5.2** Control requirements for ECSBC, ECSBC+ and Super ECSBC buildings
3831 are detailed in Chapter 13.

3832

3833 **12.6 Documentation requirements**

3834

3835 **12.6.1** Code Compliance shall be determined by the adequacy of the following
3836 documents to be submitted by the building owner to the approving
3837 authority.

3838 **12.6.2** Commissioning plan for all applicable building systems prepared by
3839 CxA and approved by the owner.

3840

3841 **12.6.3** Particulars of CxA appointed/ designated by the owner to meet
3842 ECSBC/ECSBC+ or Super ECSBC requirements.

3843 (Name, Organization, Qualification and Experience to be specified)
3844 Undertaking from owner for the post commissioning engagement of
3845 CxA for a period of three years in case of Super ECSBC Building.
3846
3847 **12.6.4** Confirmation by Owner that commissioning requirement shall be
3848 incorporated in each of the contracts for supply/installation of
3849 equipment and systems.

3850

3851

DRAFT FOR STAKEHOLDER CONSULTATION

3852

Section 13

3853

CONTROLS AND INTERNET OF THINGS

3854

DRAFT FOR STAKEHOLDER CONSULTATION

3855 **13.1 General**

3856

3857 In today's era of rapid technological advancement, the integration of Control Systems
3858 **and Internet of Things (IoT)** has emerged as a transformative force in the realm of
3859 modern buildings. The convergence of these technologies offers a wide array of
3860 benefits, ranging from improved energy efficiency and sustainability, enhanced
3861 occupant comfort, predictive maintenance and asset management, safety and
3862 security, and data driven decision making. Various ways in which Control Systems and
3863 IoT can revolutionize buildings, making them smarter, more efficient, and ultimately,
3864 more liveable ~~are the~~ are covered in this section. Buildings shall comply with
3865 mandatory requirements as per Clause 13.2 and prescriptive requirements as per
3866 Clause 13.3 respectively.

3867 **13.2 Mandatory requirements**

3868 The compliance level for ECSBC, ECSBC+ and ECSBC Super shall be as defined in
3869 13.2.1, 13.2.2 and 13.2.3.

3870 **13.2.1 Controls requirements at Equipment level and System Level**

3871 To comply with the code, ECSBC and ECSBC+ Compliant buildings shall meet the
3872 requirements of a) to c) as given below.

- 3873 a. **Equipment Level** stand-alone control and monitoring shall be provided
3874 for the equipment **as** specified in **clause 5.2.3.1 to 5.2.3.6** of Section 5
3875 on Comfort & Controls. Basement ventilation system and demand
3876 control ventilation system shall **also** comply with clause 5.2.1.2 and
3877 5.2.1.3 **of chapter 5**.
- 3878 b. **Equipment level** stand-alone monitoring of lighting, energy and water
3879 parameters shall be provided for all utilities. (Refer to section 6, section
3880 7 and section 8 respectively)
- 3881 c. **System Level** stand-alone control and monitoring shall be provided for
3882 groups of chilled water pumps, supply and extract fans with pressure
3883 sensor varying the speed of the equipment.

3884 In addition to meeting the requirements of ECSBC & ECSBC+ buildings, ECSBC Super
3885 compliant buildings shall have networked controllers to enable use the control and
3886 monitoring parameters from a computer workstation or Server for system
3887 improvements. Table 13.1 defines compliance requirement for significant

3888 components of building specified in Section 4b, 5, 6, section 7, section 8, section 9
 3889 and section 11.

3890
 3891
 3892

TABLE 13.1
Controls compliance requirement for significant components of building

| Sl. No | Application | Control & Monitoring Level | Equipment / System | Control / Monitoring for ECSBC | Control / Monitoring for ECSBC + | Control / Monitoring for ECSBC Super |

Table 13.2
Abbreviations used in Table 13.1

| Abbreviations | Full form |
|---------------|---|
| DX IDU/ODU | Direct expansion Split Unit |
| DX VRF | Direct Expansion Variable Refrigerant Flow Unit |

| | |
|------------------|---|
| CHW FCU | Chilled Water Fan Coil Unit |
| CHW AHU | Chilled Water Air Handling Unit |
| CHW Pumping | Chilled Water Pumping |
| CT Level Control | Cooling Tower Level Control |
| PHE equipment | Public Health and Engineering equipment |
| VHT | Vertical and Horizontal Transportation |

3898

3899 **13.2.2. Protocols**

3900 All unit level and system level controls protocol shall conform to ASHRAE
3901 Standards 135 – BACnet, Specification for Data Communication Protocol
3902 for Building Automation and Control Networks. Other industry standard
3903 open and accepted Protocols like OPC (Open Platform Communications),
3904 MQTT (Message Queuing Telemetry Transport), Zigbee, Wi-Fi, MODBus,
3905 M-Bus (Meter-Bus), GSM/GPRS (Global System for Mobile
3906 communication/ General Packet Radio Services), Z-wave, DLMS (Device
3907 Language Message Specification) shall be used for connecting equipment
3908 and devices like, chillers, DG sets for captive power generation, energy
3909 meters, water meters, variable speed drives and others.

3910

3911 **13.2.3 Controllers**

3912 For various applications, controllers with built-in logic or programmable
3913 control logic shall be used to achieve the desired design intents and controllers
3914 and shall meet the requirements of Clause 13.2.2 for protocol compliance.

3915

3916 **13.3 Prescriptive Requirements**

3917

3918 **13.3.1 Controls for ECSBC and ECSBC Plus buildings**

3919 a. In addition to Table 13.1, critical parameters namely, temperature,
3920 pressure, voltage, current, energy, and others shall be recorded and
3921 monitored and shall be made available for the operations team for
3922 corrective action.

3923

3924 **13.3.2. Controls for ECSBC Super**

3925 a. In addition to the various requirements as detailed for ECSBC and
3926 ECSBC+ building requirements, networked controls shall be carried
3927 out for ECSBC Super compliant buildings.

3928 b. All networked controllers system shall comply with Clause 13.2.2 for
3929 protocols used.

3930 c. Critical parameters namely, temperature, pressure, voltage, current,
3931 energy, and others shall be made available for effective monitoring
3932 and control of the system through networked centralized control
3933 system.

3934

3935 **13.3.3 Internet of Things (IoT)**

3936 IoT devices and automation shall help optimize building performance by
3937 providing data on core building operational systems and enabling
3938 automatic control of the building's main operating functions. IoT devices
3939 shall be able to connect via standard building and industry protocols as
3940 mentioned in Section 13.2.2

3941

3942 For IoT devices to be accessed and configured on the field and / or
3943 remotely shall have hardware interface and software or wireless
3944 interface for remote configuration.

3945

3946 **13.3.4 Cyber Security**

3947 Vulnerabilities in the IT based systems are diverse. Due to their physical
3948 location across all parts of a facility and connectivity with open protocols,
3949 systems are prone to technical and physical attacks at all architectural
3950 levels. System should take care of all aspects of Cyber Security. Refer to
3951 the enclosed INFORMATIVE ANNEXURE – Chapter 13.

3952 **13.3.5 Software**

3953 Software that brings in all the data and the graphics including all the functionalities
3954 to the operator workstation shall have the following options for buildings complying
3955 to ECSBC super.

3956

3957 a. Computer workstation software or Server based software for Super
3958 ECSBC buildings depending upon the number of data points for
3959 monitoring and control.

3960 b. Optional server based – on-premise or remote for ECSBC Super
3961 buildings.

3962 c. IoT & Cloud based system is optional for ECSBC Super buildings.

3963

3964 **13.3.6 Integrators/Gateways**

3965 a. High level Integrators/Gateways shall be used to ensure conversion of
3966 various protocols mentioned under Section 13.2.2.

3967 b. Protocol Conversion for equipment and devices integration of various
3968 equipment in a building shall happen when various equipment is
3969 connected through soft link to bring in the various parameters residing
3970 at the equipment to the BMS platform without installing any additional
3971 field devices. Conversion from one protocol to another protocol like,

3972 i. BACnet MSTP to BACnet/IP

3973 ii. MODBus RTU– BACnet/IP

3974 iii. MODBus TCP/IP - BACnet/IP

3975 iv. M-Bus to BACnet-IP

3976 v. MODBus – GSM / GPRS

3977

3978 **13.3.7 Dashboard**

3979 a. High level parameters as specified in the informative AnnexureA of
3980 various sub systems shall be captured on the dashboard screen and
3981 customized based on the OPR (Owners Project Requirement).

3982 i. HVAC

3983 ii. Electrical

3984 iii. Energy Management – consumption, generation

3985 iv. Water Management – levels, volume, consumption

3986 v. Sewage Treatment Plant

3987 vi. Lighting management – power consumption, circuits status,
3988 luminaire fused status

- 3989 vii. Fire – status of alarms / alerts
3990 viii. IEQ
3991 ix. Waste Management
3992 x. Occupancy status
3993 xi. UPS Management
3994
3995 b. Dashboards for ECSBC Super buildings shall capture parameters related
3996 to the following categories for trending and analysis.
- 3997 i. Energy
3998 ii. Environment
3999 iii. Comfort Systems and Controls (HVAC)
4000 iv. Lighting Control
4001 v. Water Management System
4002 vi. Electrical, VHT Systems
- 4003
4004 A suggested dashboard example of systems to be displayed is enclosed in the
4005 Informative Annex – A.
4006
4007 **13.3.8 Commissioning and Measurement & Verification (M&V) aspects related to**
4008 **various utilities:**
- 4009
4010 a. For ECSBC and ECSBC+ compliant buildings wherever stand alone and
4011 unit or equipment level controls have been provided, control and
4012 monitoring parameters shall be available for taking corrective action
4013 for the performance of the equipment and system.
4014 b. IoT-based energy management system with software & advanced
4015 analytics for:
- 4016 i. For ECSBC+ Buildings monitoring-based commissioning
4017 (MBCx) procedure to be developed to measure, monitor and
4018 assess performance of all points of utility consumption like
4019 water, electricity, other energy sources including but not
4020 limited to gas, diesel, steam, compressed air and others.
4021 ii. For ECSBC Super buildings monitoring-based commissioning
4022 (MBCx) + Advanced Measurement & Verification (M&V 2.0)

4023 infrastructure for ongoing energy performance evaluation,
4024 automated M&V, and predictive analysis capabilities.

4025 **NOTE:** All installed energy meters shall be at least Class 0.2 for building-level
4026 metering and Class 1 as defined in IS 13779 for sub-metering and have an
4027 active RS-485 port, with industry standard open protocols.

Section 14

WHOLE BUILDING PERFORMANCE

DRAFT FOR STAKEHOLDER CONSULTATION

4060 14.0 **General**

4061 The Whole Building Performance Method is an alternative to the Prescriptive Method
4062 compliance path contained in 4 through 7 of this Code. It applies to all building types
4063 covered by the Code as mentioned in §2.5.

4064 A building complies with the Code using the Whole Building Performance (WBP)
4065 Method, when the estimated EPI Ratio is equal to or less than 1, even though it may
4066 not comply with the specific provisions of the prescriptive requirements in 4 through
4067 7. The mandatory requirements of 4 through 7 (4.2, 5.2, 6.2, and 7.2) shall be met
4068 when using the WBP Method.

4069 14.1 Annual Energy consumption of the building

4070 Annual energy use for the purposes of the WBP Method shall be calculated in
4071 kilowatt-hours (kWh) of electricity use per year per unit area by using energy
4072 simulation program and climatic data as specified in section 9.3. Energy sources other
4073 than electricity that are used in the building shall be converted to kWh of electric
4074 energy at the rate of 0.75 kWh per megajoule.

4075 **NOTE:** The annual energy use calculation as per the Whole Building Performance
4076 Method is not a prediction of the actual energy use of the building once it gets
4077 operational. Actual energy performance of a building depends on a number of factors
4078 like weather, occupant behaviour, equipment performance and maintenance, among
4079 others, which are not covered by this Code.

4080 **14.1.1** Trade-offs Limited to Building Permit

4081 The WBP Method may be used for building permit applications that include less than
4082 the whole building; however, any design parameters that are not part of the building
4083 permit application shall be identical for both the Proposed Design and the Standard
4084 Design. Future improvements to the building shall comply with both the mandatory
4085 and prescriptive requirements of concurrent code.

4086 **14.1.2** Documentation Requirements

4087 Compliance shall be documented and shall be submitted to the authority having
4088 jurisdiction. The information submitted shall include, at a minimum, the following:

- 4089 (a) Summary describing the results of the analysis, including the annual energy
4090 use for the Proposed Design and the Standard Design, and software used.
4091 (b) Brief description of the project with location, number of stories, space types,
4092 conditioned and unconditioned areas, hours of operation.

- 4093 (c) List of the energy-related building features of the Proposed Design. This list
4094 shall also document features different from the Standard Design.
4095 (d) List showing compliance with the mandatory requirements of this code.
4096 (e) The input and output report(s) from the simulation program including a
4097 break up of energy usage by all the following components: lighting, internal
4098 equipment loads, service water heating equipment, space heating
4099 equipment, space cooling and heat rejection equipment, fans, and other
4100 HVAC equipment (such as pumps). The output reports shall also show the
4101 number of hours any loads which are not met by the HVAC system for both
4102 the Proposed Design and Standard Design.
4103 (f) Explanation of any significant modelling assumptions made.
4104 (g) Explanation of any error messages noted in the simulation program output.
4105 (h) Building floor plans, building elevations, and site plan.

4106 **14.2 Mandatory Requirements**

4107 All requirements of 4.2, 5.2, 6.2, and 7.2 shall be met. These sections contain the
4108 mandatory provisions of the Code and are prerequisites for demonstrating
4109 compliance using the WBP Method.

4110 **14.3 Simulation Requirements**

4111 **14.3.1 Energy Simulation Program**

4112 The simulation software shall be a computer-based program for the analysis of
4113 energy consumption in buildings and be approved by the authority having
4114 jurisdiction. The simulation program shall, at a minimum, have the ability to model
4115 the following:

- 4116 (a) Energy flows on an hourly basis for all 8,760 hours of the year,
4117 (b) Hourly variations in occupancy, lighting power, miscellaneous equipment
4118 power, thermostat set points, and HVAC system operation, defined
4119 separately for each day of the week and holidays,
4120 (c) Thermal mass effects,
4121 (d) Ten or more thermal zones,
4122 (e) Part-load and temperature dependent performance of heating and cooling
4123 equipment,
4124 (f) Air-side and water-side economizers with integrated control.

4125 In addition to the above, the simulation tool shall be able to produce hourly reports
4126 of energy use by energy source and shall have the capability to performing design
4127 load calculations to determine required HVAC equipment capacities, air, and water
4128 flow rates in accordance with 5 for both the proposed and Standard building designs.

4129 The simulation program shall be tested according to ANSI/ASHRAE Standard 140
4130 Method of Test for the Evaluation of Building Energy Analysis Computer Programs
4131 and the results shall be furnished by the software provider.

4132 **14.3.2** Climate Data

4133 The simulation program shall use hourly values of climatic data, such as temperature
4134 and humidity, from representative climatic data for the city in which the Proposed
4135 Design is to be located. For cities or urban regions with several climate data entries,
4136 and for locations where weather data are not available, the designer shall select
4137 available weather data that best represent the climate at the construction site.

4138 **14.3.3** Compliance Calculations

4139 The Proposed Design and Standard Design shall be calculated using the following:

- 4140 (a) Same simulation program,
- 4141 (b) Same weather data, and
- 4142 (c) Identical building operation assumptions (thermostat set points, schedules,
4143 equipment and occupant loads, etc.) unless an exception is allowed by this Code
4144 or the authority having jurisdiction for a given category.

4145 **14.4 Calculating Energy Consumption of Proposed Design**
4146 **and Standard Design**

4147 **14.4.1** Energy Simulation Model

4148 The simulation model for calculating the Proposed Design and the Standard Design
4149 shall be developed in accordance with the requirements in Table 14-1. The Standard
4150 Design is based on the mandatory and prescriptive requirements of the ECSBC
4151 compliant building. The Standard Design will be the same for all compliance levels
4152 (ECSBC, ECSBC+, Super ECSBC).

4153 Table 14-1 Modelling Requirements for Calculating Proposed and Standard Design

| <i>Case</i> | <i>Proposed Design</i> | <i>Standard Design</i> |
|---|--|--|
| <p>1. Design Model</p> | <p>(a) The simulation model of the Proposed Design shall be consistent with the design documents, including proper accounting of fenestration and opaque envelope types and area; interior lighting power and controls; HVAC system types, sizes, and controls; and service water heating systems and controls.</p> <p>(b) When the whole building performance method is applied to buildings in which energy-related features have not been designed yet (e.g., a lighting system), those yet-to-be-designed features shall be described in the Proposed Design so that they minimally comply with applicable mandatory and prescriptive requirements of 4B.2, 5.2, 6.2, and 7.2 and 4B.3, 5.3, and 6.3 respectively.</p> | <p>The Standard Design shall be developed by modifying the Proposed Design as described in this table. Unless specified in this table, all building systems and equipment shall be modelled identically in the Standard Design and Proposed Design.</p> |
| <p>2. Space Use Classification</p> | <p>The building type or space type classifications shall be chosen in accordance with 2.5. More than one building type category may be used in a building if it is a mixed-use facility.</p> | <p>Same as Proposed Design.</p> |
| <p>3. Schedules</p> | <p>Operational schedules (hourly variations in occupancy, lighting power, equipment power, HVAC equipment operation, etc.) suitable for the building and/or space type shall be modeled for showing compliance. Schedules must be modeled as per §14.6. In case a schedule for an occupancy type is missing in §14.6, appropriate schedule may be used. Temperature and humidity schedules and set points shall be identical in the Standard and Proposed Designs. Temperature control/thermostat throttling ranges shall also be modelled identically in both the Designs.</p> | <p>Same as Proposed Design. Exception: Schedules may be allowed to differ between the Standard and Proposed models wherever it is necessary to model nonstandard efficiency measures and/or measures which can be best approximated by a change in schedule. Measures that may warrant a change in operating schedules include but are not limited to automatic controls for lighting, natural ventilation, demand-controlled ventilation systems, controls for service water heating load reduction. Schedule change is not allowed for manual controls under any category. This is subject to approval by the authority having jurisdiction.</p> |

| <i>Case</i> | <i>Proposed Design</i> | <i>Standard Design</i> |
|--|--|--|
| <p>4. Building Envelope</p> | <p>All components of the building envelope in the Proposed Design shall be modelled as shown on architectural drawings or as installed for existing building envelopes. Exceptions: The following building elements are permitted to differ from architectural drawings.</p> <p>(a) Any envelope assembly that covers less than 5% of the total area of that assembly type (e.g., exterior walls) need not be separately described. If not separately described, the area of an envelope assembly must be added to the area of the adjacent assembly of that same type.</p> <p>(b) Exterior surfaces whose azimuth orientation and tilt differ by no more than 45 degrees and are otherwise the same may be described as either a single surface or by using multipliers.</p> <p>(c) For exterior roofs, other than roofs with ventilated attics, the reflectance and emittance of the roof surface shall be modelled in accordance with 4B.3.1.1.</p> <p>(d) Manually operated fenestration shading devices such as blinds or shades shall not be modelled. Permanent shading devices such as fins, overhangs, and light shelves shall be modelled.</p> <p>(e) The exterior roof surface shall be modelled using the solar reflectance in accordance with ASTM E903-96 and thermal emittance determined in accordance with ASTM E408-71. Where cool roof is proposed, emittance and reflectance shall be modelled as per ASTM E408-71 and ASTM E903-96 respectively. Where cool roof is not proposed, the exterior roof surfaces shall be modelled with a solar reflectance of 0.3 and a thermal emittance of 0.75.</p> | <p>The Standard Design shall have identical conditioned floor area and identical exterior dimensions and orientations as the Proposed Design, except as noted in (a), (b), (c), (d) and (e) below.</p> <p>(a) Orientation. The Standard Design performance shall be generated by simulating the building with its actual orientation and again after rotating the entire building 90, 180, 270 degrees, then averaging the results. The building shall be modelled so that it does not shade itself.</p> <p>(b) Opaque assemblies such as roof, floors, doors, and walls shall be modelled with the maximum U-factor allowed in 4B.3.1 and 4B.3.2.</p> <p>(c) Fenestration. Fenestration areas shall equal that in the Proposed Design or 40% of gross above grade wall area, whichever is smaller, and shall be distributed on each face in the same proportions as in the Proposed Design. No shading projections are to be modelled; fenestration shall be assumed to be flush with the exterior wall or roof. Manually operated fenestration shading devices such as blinds or shades shall not be modelled. Fenestration U-factor shall be the maximum allowed for the climate, and the solar heat gain coefficient shall be the maximum allowed for the climate and orientation.</p> <p>(d) Skylight areas shall equal that in the Proposed Design or 5% of gross roof area, whichever is smaller.</p> <p>(e) Roof Solar Reflectance and Thermal Emittance: The exterior roof surfaces shall be modelled using a solar reflectance of 0.70 and a thermal emittance of 0.75 as per 4B.3.1.1</p> |

| <i>Case</i> | <i>Proposed Design</i> | <i>Standard Design</i> |
|---|--|--|
| <p data-bbox="297 688 391 779">5. Lighting</p> | <p data-bbox="461 218 878 273">Lighting power in the Proposed Design shall be determined as follows:</p> <p data-bbox="461 277 878 359">Where a complete lighting system exists, the actual lighting power shall be used in the model.</p> <p data-bbox="461 363 878 445">Where a lighting system has been designed, lighting power shall be determined in accordance with 6.3.4.</p> <p data-bbox="461 449 878 562">Where no lighting exists, or is specified, lighting power shall be determined in accordance with the 6.3.2 or 6.3.3 for the appropriate building type.</p> <p data-bbox="461 567 878 707">Lighting system power shall include all lighting system components shown or provided for on plans (including lamps, ballasts, task fixtures, and furniture-mounted fixtures).</p> <p data-bbox="461 711 878 793">Lighting power for parking garages, exterior spaces and building facades shall be modelled.</p> <p data-bbox="461 798 878 879">Minimum Lighting controls, as per the ECSBC requirements of 6.2.1, shall be modelled in the Proposed case.</p> <p data-bbox="461 884 878 1035">Automatic daylighting controls shall be modelled directly in the software or through schedule adjustments determined by a separate daylight analysis approved by the authority having jurisdiction.</p> <p data-bbox="461 1039 878 1176">Other automatic lighting controls shall be modelled directly in the software by adjusting the lighting power as per Table 14-3.</p> | <p data-bbox="906 455 1299 856">Interior lighting power in the Standard Design shall be determined using the same categorization procedure (building area or space function) and categories as the Proposed Design with lighting power set equal to the maximum allowed for the corresponding method and category in either 6.3.2 or 6.3.3. Power for fixtures not included in the lighting power density calculation shall be modelled identically in the Proposed Design and Standard Design. Lighting controls shall be as per the ECSBC requirements of 6.2.1.</p> <p data-bbox="906 890 1299 972">Exterior lighting power in the standard design shall be set equal to the maximum allowed in 6.3.5</p> |

| <i>Case</i> | <i>Proposed Design</i> | <i>Standard Design</i> |
|---|--|--------------------------------|
| <p>6. HVAC Thermal Zones</p> | <p>HVAC Zones Designed: Where HVAC zones are defined on design drawings, each HVAC zone shall be modelled as a separate thermal block.</p> <p>Exception: Identical zones (similar occupancy and usage, similar internal loads, similar set points and type of HVAC system, glazed exterior walls face the same orientation or vary by less than 45°) may be combined for simplicity.</p> <p>HVAC Zones Not Designed: Where HVAC zones are not defined on design drawings, HVAC zones shall be defined based on similar occupancy and usage, similar internal loads, similar set points and type of HVAC system, glazed exterior walls that face the same orientation or vary by less than 45° in combination with the following rules:</p> <p>Perimeter Core Zoning: Separate thermal block shall be modelled for perimeter and core spaces. Perimeter spaces are defined as spaces located within 5 meters of an exterior or semi exterior wall. Core spaces are defined as spaces located greater than 5 meters of an exterior or semi exterior wall.</p> <p>Separate thermal blocks shall be modelled for floors in contact with ground and for floors which have a ceiling/roof exposure to the ambient.</p> | <p>Same as Proposed Design</p> |

| <i>Case</i> | <i>Proposed Design</i> | <i>Standard Design</i> |
|--------------------------------|---|--|
| <p>7. HVAC Systems</p> | <p>The HVAC system type and all related performance parameters, such as equipment capacities and efficiencies, in the Proposed Design shall be determined as follows:</p> <p>(a) Where a complete HVAC system exists, the model shall reflect the actual system type using actual component capacities and efficiencies.</p> <p>(b) Where an HVAC system has been designed, the HVAC model shall be consistent with design documents. Mechanical equipment efficiencies shall be adjusted from actual design conditions to the rating conditions specified in 5, if required by the simulation model.</p> <p>(c) Where no heating system has been specified, the heating system shall be assumed to be electric. The system characteristics shall be identical to the system modelled in the Standard Design.</p> <p>(d) Where no cooling system has been specified, the cooling system and its characteristics shall be identical to the system modelled in the Standard Design.</p> <p>(e) For projects, which shall have VRF systems in proposed design, project team shall have to submit following performance curves of proposed VRF systems:</p> <ol style="list-style-type: none"> 1. EIR vs PLR (Part Load Ratio) 2. Total Capacity; f (evaporator entering wet bulb temperature, condenser entering dry bulb temperature) 3. Electric Input Ratio; f (evaporator entering wet bulb temperature, condenser entering dry bulb temperature) | <p>The HVAC system type shall be as per Table 14-2 and related performance parameters for the Standard Design shall be determined from requirements of 14.4.2. Equipment performance shall meet the requirements of 5 for code compliant building.</p> |

| <i>Case</i> | <i>Proposed Design</i> | <i>Standard Design</i> |
|---|--|--|
| <p>8. Service Hot Water</p> | <p>The service hot water system type and all related performance parameters, such as equipment capacities and efficiencies, in the Proposed Design shall be determined as follows:</p> <p>(a) Where a complete service hot water system exists, the model shall reflect the actual system type using actual component capacities and efficiencies.</p> <p>(b) Where a service hot water system has been designed, the service hot water model shall be consistent with design documents.</p> <p>(c) Where no service hot water system exists, or is specified, no service hot water heating shall be modelled.</p> | <p>The service water heating system shall be of the same type as the Proposed Design.</p> <p>For residential facilities, hotels and hospitals the Standard Design shall have a solar hot water system capable of meeting 20% of the hot water demand. Systems shall meet the efficiency requirements of 5.2.7.2.</p> |
| <p>9. Miscellaneous Loads</p> | <p>Receptacle, motor, and process loads shall be modelled and estimated based on the building type or space type category. These loads shall be included in simulations of the building and shall be included when calculating the Standard Design and Proposed Design. All end-use load components within and associated with the building shall be modelled, unless specifically excluded by this Table, but not limited to, exhaust fans, parking garage ventilation fans, exterior building lighting, swimming pool heaters and pumps, elevators and escalators, refrigeration equipment, and cooking equipment.</p> | <p>Receptacle, motor and process loads shall be modelled the same as the Proposed Design.</p> |
| <p>10. Modelling Limitations to the Simulation Program</p> | <p>If the simulation program cannot model a component or system included in the Proposed Design, one of the following methods shall be used with the approval of the authority having jurisdiction:</p> <p>(a) Ignore the component if the energy impact on the trade-offs being considered is not significant.</p> <p>(b) Model the component substituting a thermodynamically similar component model.</p> <p>(c) Model the HVAC system components or systems using the HVAC system of the Standard Design in accordance with Section 6 of this table.</p> <p>Whichever method is selected, the component shall be modelled identically for both the Proposed Design and Standard Design models.</p> | <p>Same as Proposed Design.</p> |

DRAFT

Notes:

1. Buildings of the listed occupancy types or spaces in Mixed-use Buildings with the listed occupancy types.

2. Where attributes make a building eligible for more than one system type; use the predominant condition to determine the Standard Design system type provided the non-predominant conditions apply to less than 1,000 m² of conditioned floor area. Use additional system type for non-predominant conditions if those conditions apply to more than 1,000 m² of conditioned floor area.

Use additional system type for any space which has a substantial difference in peak loads and/or operational hours compared to the predominant space type. Such spaces may include but are not limited to computer/server rooms, retail areas in residential, or office buildings.

3. One AHU per floor at a minimum.

|--|---|-------------------|
| Programmable Timing Control | 10% | 0% |
| Occupancy Sensor | 10% | 10% |
| Occupancy Sensor and Programmable Timing Control | 15% | 10% |

4157

14.4.2 HVAC Systems

4158

The HVAC system type and related performance parameters for the Standard

4159

Design shall be determined from Table 14-2 and the following rules:

4160

(a) Other components: Components and parameters not listed in Table 14-2 or

4161

otherwise specifically addressed in this subsection shall be identical to those

4162

in the Proposed Design.

4163 Exception to 14.4.2(a): Where there are specific requirements in 5.2.2, the
4164 component efficiency in the Standard Design shall be adjusted to the lowest
4165 efficiency level allowed by the requirement for that component type.

4166 (b) All HVAC and service water heating equipment in the Standard Design shall
4167 be modelled at the minimum efficiency levels, both part load and full load, in
4168 accordance with 5.2.2.

4169 (c) Where efficiency ratings, such as EER and COP, include fan energy, the
4170 descriptor shall be broken down into its components so that supply fan
4171 energy can be modelled separately.

4172 (d) Minimum outdoor air ventilation rates shall be the same for both the
4173 Standard Design and the Proposed Design except for conditions specified in
4174 9.4.2.1.

4175 (e) The equipment capacity for the standard design shall be based on sizing runs
4176 for each orientation and shall be oversized by 15% for cooling and 25% for
4177 heating, i.e., the ratio between the capacities determined by the sizing runs
4178 shall be 1.15 for cooling and 1.25 for heating.

4179 (f) Unmet load hours for the Proposed Design shall not differ from unmet load
4180 hours for the Standard Design by more than 50 hours. Maximum number of
4181 unmet hours shall not exceed 300 for either case.

4182 *14.4.2.1 Minimum Outdoor air rates*

4183 Minimum outdoor air rates shall be identical for both the Standard Design and
4184 Proposed Design, except

4185 (a) when modelling demand-controlled ventilation (DCV) in the Proposed
4186 Design (DCV is not required in the Standard Design as per 5.2.1.3.

4187 When the proposed design has a ventilation flow higher than the minimum required
4188 by the applicable code, the standard design shall be modelled as per the minimum
4189 ventilation rate required by the applicable code and the Proposed Design shall be
4190 modelled as per actual design (higher than standard design)

4191 *14.4.2.2 Fan Schedules*

4192 Supply and return fans shall operate continuously whenever the spaces are occupied
4193 and shall be cycled to meet heating and cooling loads during unoccupied hours.

4194 *14.4.2.3 Fan Power*

4195

4196 (a) For Systems Types A, B and D,

4197 $P_{fan} = cmh \times 0.176$

4198 Where P_{fan} = Standard Design fan power in watts

4199 cmh = Standard Design supply airflow rate auto-sized by the simulation software

4200

4201 (b) For System B - VRF: Variable Refrigerant Flow system, the performance curve
4202 for Baseline shall be modelled using either equation 1 or table 2.

4203 Equation 1

4204 $EIR(PLR) = 0.4628 - 1.0402 * PLR + 2.1749 * PLR^2 - 0.5975 * PLR^3$

4205 Table 2

| Part load ratio (PLR) | EIR | Part load ratio (PLR) | EIR |
|-----------------------|--------|-----------------------|--------|
| 0.1 | 0.3799 | 0.6 | 0.4926 |
| 0.2 | 0.3370 | 0.7 | 0.5954 |
| 0.3 | 0.3304 | 0.8 | 0.7167 |
| 0.4 | 0.3565 | 0.9 | 0.8527 |
| 0.5 | 0.4117 | 1 | 1 |

4206

4207 (c) For System Type C

4208 Fan power shall be modelled as per efficiency limits specified in Table 5-9 using a
4209 static pressure of 622 Pa or the design static pressure, whichever is higher. The
4210 simulation software shall automatically calculate the Standard Design fan power
4211 based on the above inputs.

4212 VAV system type C

4213 supply fans shall have variable-speed drives, and their part-load performance
4214 characteristics shall be modelled using either Method 1 and Method 2 specified given
4215 below.

4216 Method 1:

| Part Load Fan Power Data | |
|--------------------------|-----------------------------|
| Fan Part-Load Ratio | Fraction of Full-Load Power |

| | |
|-----|------|
| 0 | 0 |
| 0.1 | 0.03 |
| 0.2 | 0.07 |
| 0.3 | 0.13 |
| 0.4 | 0.21 |
| 0.5 | 0.3 |
| 0.6 | 0.41 |
| 0.7 | 0.54 |
| 0.8 | 0.68 |
| 0.9 | 0.83 |
| 1 | 1 |

4217 Method 2

4218 $P_{fan} = 0.0013 + 0.1470 * (PLR_{fan}) + 0.9506 * (PLR_{fan})^2 - 0.0998 * (PLR_{fan})^3$

4219 Where;

4220 P_{fan} = fraction of full load fan power,

4221 PLR_{fan} = Fan part-load ratio (Current L/s/Design L/s)

4222 *14.4.2.4 Design Airflow Rates*

4223 Design airflow rates for the Standard Design shall be sized based on a supply air to
 4224 room air temperature difference of 11 °C for cooling and 18°C for heating. The
 4225 Proposed Design airflow rates shall be as per design.

4226 *14.4.2.5 Economizers (airside and waterside)*

4227 Airside economizers shall be modelled in the Standard Design as per the
 4228 requirements of 5.3.6.

4229 Exception to 14.4.2.5: Airside economizer shall not be modelled for Standard Design
 4230 HVAC System Type A.

4231 *14.4.2.6 Energy Recovery*

4232 Energy recovery shall be modelled in the Standard Design as per the requirements of
4233 5.3.

4234 *14.4.2.7 Chilled Water Design Supply Temperatures*

4235 Chilled water design supply temperature shall be modelled at 6.7°C and return
4236 temperature at 13.3°C.

4237 *14.4.2.8 Chillers*

4238 Only electric chillers shall be modelled in the Standard Design for System C. Chillers
4239 shall meet the minimum efficiency requirements indicated in Table 14-4 and Table
4240 14-5. Chillers in the Standard Design shall be selected as per Table 14.6 below:

DRAFT FOR STAKEHOLDER CONSULTATION

4241 Table 14-4 Minimum Energy Efficiency Requirements for water cooled Chillers.

| Chiller Capacity (kW) | COP | IPLV |
|-----------------------|-----|------|
| <260 | 4.7 | 5.8 |
| ≥260 & <530 | 4.9 | 5.9 |
| ≥530 & <1,050 | 5.4 | 6.5 |
| ≥1,050 & <1,580 | 5.8 | 6.8 |
| ≥1,580 | 6.3 | 7.0 |

4242 Table 14-5 Minimum Energy Efficiency Requirements for air cooled Chillers

| Chiller Capacity (kW) | COP | IPLV |
|-----------------------|-----|------|
| <260 | 2.8 | 3.5 |
| ≥260 | 3.0 | 3.7 |

| Peak Building Cooling Load (kW) | Chiller Type |
|---------------------------------|---|
| < 1,055 | 1 Water Cooled Screw Chiller |
| 1,055 to 2,110 | 2 Water Cooled Screw Chillers equally sized |
| > 2,110 | 2 or more Water Cooled Centrifugal Chillers, equally sized such that no Chiller is greater than 2,813 kW _r |

4244 Exception to 14.4.2.8: Air cooled chillers are allowed to be modelled in the Standard
 4245 Design if the Proposed Design has air cooled chillers. If the proposed building has a
 4246 mix of air- and water-cooled chillers, then the Standard Design shall be modelled with
 4247 a mix of air- and water-cooled chillers in the same proportion as in the Proposed
 4248 Design.

4249

14.4.2.9 Chilled Water Pumps

4250 Chilled and condenser water pumps for the Standard Design shall be modelled as
4251 per power and efficiency limits specified in Table 5-12. Standard design chilled
4252 water pumps shall be modelled as primary-secondary with variable secondary flow.

4253 *14.4.2.10 Cooling Tower*

4254 Standard design cooling tower shall be modelled as an open circuit axial flow tower
4255 with power and efficiency as per 5.3.3. The fans shall be modelled as two speed.

4256 Condenser water design supply temperature shall be 29.4°C or 5.6°C approach to wet
4257 bulb temperature, whichever is lower, with a design temperature rise of 5.6°C.

4258 *14.4.2.11 Boiler*

4259 Standard Design boilers shall be modelled as natural draft boilers and shall use the
4260 same fuel as the Proposed Design. Boiler efficiency shall be modelled as per Table 5-
4261 4.

4262 *14.4.2.12 Hot Water Design Supply Temperatures*

4263 Hot water design supply temperature shall be modelled at 82°C and return
4264 temperature at 54°C.

4265 *14.4.2.13 Hot Water Pumps*

4266 The standard design hot water pumps shall be modelled with a minimum efficiency
4267 of 70% and a pump power of 300 W/l-s⁻¹.

4268 Standard design hot water pumps shall be modelled as primary-secondary with
4269 variable secondary flow.

4270 *14.4.2.14 Campus/District Cooling Systems*

4271 All district cooling plants shall be assumed to be on grid electricity, unless otherwise
4272 specified and supported through pertinent documents. New district plants shall
4273 comply with the mandatory requirements of ECSBC irrespective of who owns and/or
4274 operates the district plant.

4275 Projects may choose either option A or option B given below for modelling
4276 campus/district cooling systems.

4277 **Option A**

4278 The cooling source shall be modelled as purchased chilled water in both the
4279 Standard Design and proposed design. For the standard design, Table 14-2, shall be
4280 modified as follows:

4281 (a) For System Type C; purchased chilled water shall be modelled as the cooling
4282 source.

4283 (b) System Types A and B shall be replaced with a two-pipe fan coil system with
4284 purchased chilled water as the cooling source.

4285 The chilled water/thermal energy consumption simulated by the software shall be
4286 converted to units of kWh and added to the overall building energy consumption.

4287 The following conversion factors shall be used to convert chilled water/thermal
4288 energy consumption to units of kWh.

1 ton hour = 0.85 kWh

1 MBtu = 1,000,000 Btu = 293 kWh

4289 **Option B**

4290 The standard design shall be modelled as per Table 9142 HVAC Systems Map.

4291 For the proposed design, model a virtual onsite chilled water plant with Chiller,
4292 Pumps and cooling towers modelled at minimum efficiency levels as per 14.4.2.7 to
4293 14.4.2.10. Airside/low side capacities shall be modelled as per design and the plant
4294 capacities shall be auto-sized by the software.

4295 **14.4.3 Compliance Thresholds for ECSBC compliant, ECSBC+ and SuperECSBC**
4296 **Buildings**

4297 For buildings to qualify as ECSBC+ and SuperECSBC Buildings, the WBP Method shall
4298 be followed for the standard design as detailed above. The proposed design for
4299 ECSBC+ and SuperECSBC buildings shall meet the mandatory provisions of 4.2, 5.2,
4300 6.2, and 7.2.

4301 The EPI Ratio for ECSBC+ and SuperECSBC Buildings shall be equal to or less than the
4302 EPI Ratios listed under the applicable climate zone in Table 14-7 through Table 14-11
4303 of clause 14.5.

4305 Table 14-7 Maximum Allowed EPI Ratios for Building in Composite Climate
