\*\* Note - It shall be mandatory to record the energy supplied separately for each category of consumers which is being provided a separate rate of subsidy in the tariff, by the state government, so that the subsidy due for the electricity distribution company is quarterly calculated by multiplying the energy supplied to each of such category of consumers by the applicable rate of subsidy notified by the state government  
Billing energy and amount is as per billing month and collection is as per due date of respective billing months.  
No of consumers as per consumer category and their connected load is as per the last billing month of the quarter.  
KWH energy of HT consumers is derived from metered KVAH and average PF for calculation of divisional energy inputs.  
Change over consumers no, connected load and energy sale is included in the report.

**Note:**

In AEML we do not have zone, circle entire distribution area is divided into 7 nos. of divisions & 25 nos. of subdivisions.

Meters are read manually using CMRI / Mobile as of now on monthly basis.

DT mapping on feeders is done, however, due to changes in network for planned and unplanned outages the final export at feeder level is getting affected.

Due to ring main system and dynamic changes in the HT network under fault or planned outages, loss calculation is difficult till complete implementation of AMR for feeder and DT metering.

AMR - Static communicable meters & AMI - Smart meters

**Details of DT-wise losses (please add more rows as per requirement)**

Substation ID - SAP code of respective substation, Feeder ID - Feeder switch no

DT Meters are read manually using CMRI as of now on monthly basis and reset reading is used for consumption calculation.

Energy meters are connected for each DT, however, input energy consumption is the sum of the DTs installed in the respective substation. Billed Energy - it is the summation of the prorated consumption of the consumers tagged to the respective substation as per the monthly billing cycle. Due to back feeding arrangement at LT network and dynamic changes in the LT network under fault or planned outages, loss calculation is not very accurate till complete implementation of AMR for DT metering and LT consumers. Abnormal (Negative or 100%) loss is due to the pending consumer tagging updation on GIS
